

Quadrilaterals Ex 14.4 Q8

Answer :

We have $\triangle ABC$ as follows:

M , N and P are the mid-points of sides AB , AC and BC respectively.

Also, $MN = 3\text{cm}$, $NP = 3.5\text{cm}$ and $MP = 2.5\text{cm}$

We need to calculate BC , AB and AC .

In $\triangle ABC$, M and N are the mid-points of AB and AC respectively.

Theorem states, the line segment joining the mid-points of any two sides of a triangle is parallel to the third side and equal to half of it.

Therefore,

$$MN = \frac{1}{2} BC$$

$$BC = 2MN$$

$$BC = 2(3\text{ cm})$$

$$BC = \boxed{6\text{ cm}}$$

Similarly,

$$NP = \frac{1}{2} AB$$

$$AB = 2NP$$

$$AB = 2(3.5\text{cm})$$

$$AB = \boxed{7\text{cm}}$$

And

$$MP = \frac{1}{2} AC$$

$$AC = 2MP$$

$$AC = 2(2.5\text{cm})$$

$$AC = \boxed{5\text{cm}}$$

Hence, the measure for BC , AB and AC is $\boxed{6\text{cm}}$, $\boxed{7\text{cm}}$ and $\boxed{5\text{cm}}$ respectively.

Quadrilaterals Ex 14.4 Q9

Answer :

We have $\triangle ABC$ as follows:

Through A, B and C lines are drawn parallel to BC , CA and AB respectively intersecting at P , Q and R respectively.

We need to prove that perimeter of $\triangle PQR$ is double the perimeter of $\triangle ABC$.

$AB \parallel CQ$ and $BC \parallel AQ$

Therefore, $AB CQ$ is a parallelogram.

Thus, $BC = AQ$

Similarly,

$ARBC$ is a parallelogram.

Thus, $BC = AR$

Therefore,

$AQ = AR$

Then, we can say that A is the mid-point of QR .

Similarly, we can say that B and C are the mid-point of PR and PQ respectively.

In $\triangle PQR$, $AC \parallel PR$

Theorem states, the line drawn through the mid-point of any one side of a triangle is parallel to the another side, intersects the third side at its mid-point.

Therefore, $AC = \frac{1}{2} PR$

$PR = 2AC$

Similarly,

$BC = \frac{1}{2} QR$

$QR = 2BC$

And $AB = \frac{1}{2} PQ$

$PQ = 2AB$

$PQ + QR + PR = 2AB + 2BC + 2CA$

$PQ + QR + PR = 2(AB + BC + AC)$

Perimeter of $\triangle PQR$ is double the perimeter of $\triangle ABC$

Hence proved.
