

### Exercise 11A

Question 20:

Given :  $AB$  and  $AC$  are two equal chords of a circle with centre  $O$

To Prove:  $\angle OAB = \angle OAC$

Construction: Join  $OA$ ,  $OB$  and  $OC$ .

Proof: In  $\triangle OAB$  and  $\triangle OAC$ ,

$$AB = AC \quad [\text{Given}]$$

$$OA = OA \quad [\text{common}]$$

$$OB = OC \quad [\text{Radii}]$$

Thus by Side-Side-Side criterion of congruence, we have

$$\therefore \triangle OAB \cong \triangle OAC \quad [\text{by SSS}]$$

The corresponding parts of the congruent triangles are equal.

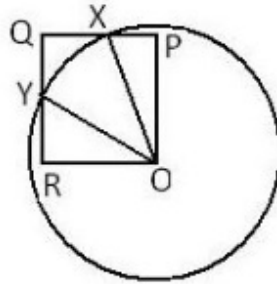

$$\Rightarrow \angle OAB = \angle OAC \quad [\text{by C.P.C.T.}]$$

Therefore,  $O$  lies on the bisector of  $\angle BAC$

Question 21:

Given: OPQR is a square. A circle with centre O cuts the square in X and Y.

To Prove:  $QX = QY$

Construction: Join OX and OY.

Proof: In  $\triangle OXP$  and  $\triangle OYR$

$$\angle OPX = \angle ORY \quad [\text{Each equal to } 90^\circ]$$

$$OX = OY \quad [\text{Radii}]$$

$$OP = OR \quad [\text{Sides of a square}]$$

Thus by Right Angle-Hypotenuse-Side criterion of congruence, we have,

$$\therefore \triangle OXP \cong \triangle OYR \quad [\text{by RHS}]$$

The corresponding parts of the congruent triangles are equal.

$$\Rightarrow PX = RY \quad [\text{by C.P.C.T.}]$$

$$\Rightarrow PQ - PX = QR - RY \quad [\because PQ = QR]$$

$$\therefore QX = QY.$$
