

NCERT solutions for class 9 Maths Polynomials Ex 2.4

Q1. Determine which of the following polynomials has $(x+1)$ a factor:

(i) $x^3 + x^2 + x + 1$

(ii) $x^4 + x^3 + x^2 + x + 1$

(iii) $x^4 + 3x^3 + 3x^2 + x + 1$

(iv) $x^3 - x^2 - (2 + \sqrt{2})x + \sqrt{2}$

Ans: (i) $x^3 + x^2 + x + 1$

While applying the factor theorem, we get

$$p(x) = x^3 + x^2 + x + 1$$

$$p(-1) = (-1)^3 + (-1)^2 + (-1) + 1$$

$$= -1 + 1 - 1 + 1$$

$$= 0$$

We conclude that on dividing the polynomial

$x^3 + x^2 + x + 1$ by $(x+1)$, we get the remainder as 0.

Therefore, we conclude that $(x+1)$ is a factor of $x^3 + x^2 + x + 1$.

(ii) $x^4 + x^3 + x^2 + x + 1$

While applying the factor theorem, we get

$$p(x) = x^4 + x^3 + x^2 + x + 1$$

$$p(-1) = (-1)^4 + (-1)^3 + (-1)^2 + (-1) + 1$$

$$= 1 - 1 + 1 - 1 + 1$$

$$= 1$$

We conclude that on dividing the polynomial

$x^4 + x^3 + x^2 + x + 1$ by $(x+1)$, we will get the remainder as 1, which is not 0.

Therefore, we conclude that $(x+1)$ is not a factor of $x^4 + x^3 + x^2 + x + 1$.

(iii) $x^4 + 3x^3 + 3x^2 + x + 1$

While applying the factor theorem, we get

$$p(x) = x^4 + 3x^3 + 3x^2 + x + 1$$

$$p(-1) = (-1)^4 + 3(-1)^3 + 3(-1)^2 + (-1) + 1$$

$$=1-3+3-1+1$$

$$=1$$

We conclude that on dividing the polynomial $x^4 + 3x^3 + 3x^2 + x + 1$ by $(x+1)$, we will get the remainder as 1, which is not 0.

Therefore, we conclude that $(x+1)$ is not a factor of $x^4 + 3x^3 + 3x^2 + x + 1$.

$$\text{(iv)} \quad x^3 - x^2 - (2 + \sqrt{2})x + \sqrt{2}$$

While applying the factor theorem, we get

$$p(x) = x^3 - x^2 - (2 + \sqrt{2})x + \sqrt{2}$$

$$p(-1) = (-1)^3 - (-1)^2 - (2 + \sqrt{2})(-1) + \sqrt{2}$$

$$= -1 - 1 + 2 + \sqrt{2} + \sqrt{2}$$

$$= 2\sqrt{2}.$$

We conclude that on dividing the polynomial $x^3 - x^2 - (2 + \sqrt{2})x + \sqrt{2}$ by $(x+1)$, we will get the remainder as $2\sqrt{2}$, which is not 0.

Therefore, we conclude that $(x+1)$ is not a factor of $x^3 - x^2 - (2 + \sqrt{2})x + \sqrt{2}$.

Q2. Use the Factor Theorem to determine whether $g(x)$ is a factor of $p(x)$ in each of the following cases:

$$\text{(i)} \quad p(x) = 2x^3 + x^2 - 2x - 1, g(x) = x + 1$$

$$\text{(ii)} \quad p(x) = x^3 + 3x^2 + 3x + 1, g(x) = x + 2$$

$$\text{(iii)} \quad p(x) = x^3 - 4x^2 + x + 6, g(x) = x - 3$$

$$\text{Ans: (i)} \quad p(x) = 2x^3 + x^2 - 2x - 1, g(x) = x + 1$$

We know that according to the factor theorem, $(x - a)$ is a factor of $p(x)$, if $p(a) = 0$.

We can conclude that $g(x)$ is a factor of $p(x)$, if $p(-1) = 0$.

$$\begin{aligned}
 p(-1) &= 2(-1)^3 + (-1)^2 - 2(-1) - 1 \\
 &= 2 + 1 - 1 - 2 \\
 &= 0
 \end{aligned}$$

Therefore, we conclude that the $g(x)$ is a factor of $p(x)$.

$$(ii) \quad p(x) = x^3 + 3x^2 + 3x + 1, \quad g(x) = x + 2$$

We know that according to the factor theorem, $(x - a)$ is a factor of $p(x)$, if $p(a) = 0$.

We can conclude that $g(x)$ is a factor of $p(x)$, if $p(-2) = 0$.

$$\begin{aligned}
 p(-2) &= (-2)^3 + 3(-2)^2 + 3(-2) + 1 \\
 &= -8 + 12 - 6 + 1 \\
 &= -1
 \end{aligned}$$

Therefore, we conclude that the $g(x)$ is not a factor of $p(x)$.

$$(iii) \quad p(x) = x^3 - 4x^2 + x + 6, \quad g(x) = x - 3$$

We know that according to the factor theorem, $(x - a)$ is a factor of $p(x)$, if $p(a) = 0$.

We can conclude that $g(x)$ is a factor of $p(x)$, if $p(3) = 0$.

$$\begin{aligned}
 p(3) &= (3)^3 - 4(3)^2 + (3) + 6 \\
 &= 27 - 36 + 3 + 6 \\
 &= 0
 \end{aligned}$$

Therefore, we conclude that the $g(x)$ is a factor of $p(x)$.

Q3. Find the value of k , if $x - 1$ is a factor of $p(x)$ in each of the following cases:

$$(i) \quad p(x) = x^2 + x + k$$

$$(ii) \quad p(x) = 2x^2 + kx + \sqrt{2}$$

$$(iii) \quad p(x) = kx^2 - \sqrt{2}x + 1$$

$$(iv) \quad p(x) = kx^2 - 3x + k$$

Ans: (i) $p(x) = x^2 + x + k$

We know that according to the factor theorem

$$p(a) = 0, \text{ if } x - a \text{ is a factor of } p(x).$$

We conclude that if $(x - 1)$ is a factor of

$$p(x) = x^2 + x + k, \text{ then } p(1) = 0.$$

$$p(1) = (1)^2 + (1) + k = 0, \text{ or}$$

$$k + 2 = 0$$

$$k = -2$$

Therefore, we can conclude that the value of k is -2 .

(ii) $p(x) = 2x^2 + kx + \sqrt{2}$

We know that according to the factor theorem

$$p(a) = 0, \text{ if } x - a \text{ is a factor of } p(x).$$

We conclude that if $(x - 1)$ is a factor of

$$p(x) = 2x^2 + kx + \sqrt{2}, \text{ then } p(1) = 0.$$

$$p(1) = 2(1)^2 + k(1) + \sqrt{2} = 0, \text{ or}$$

$$2 + k + \sqrt{2} = 0$$

$$k = -(2 + \sqrt{2}).$$

Therefore, we can conclude that the value of k is $-(2 + \sqrt{2})$.

(iii) $p(x) = kx^2 - \sqrt{2}x + 1$

We know that according to the factor theorem

$$p(a) = 0, \text{ if } x - a \text{ is a factor of } p(x).$$

We conclude that if $(x - 1)$ is a factor of

$$p(x) = kx^2 - \sqrt{2}x + 1, \text{ then } p(1) = 0.$$

$$p(1) = k(1)^2 - \sqrt{2}(1) + 1 = 0, \text{ or}$$

$$k - \sqrt{2} + 1 = 0$$

$$k = \sqrt{2} - 1.$$

Therefore, we can conclude that the value of k is $\sqrt{2}-1$.

(iv) $p(x) = kx^2 - 3x + k$

We know that according to the factor theorem

$p(a) = 0$, if $x - a$ is a factor of $p(x)$

We conclude that if $(x-1)$ is a factor of

$p(x) = kx^2 - 3x + k$, then $p(1) = 0$.

$$p(1) = k(1)^2 - 3(1) + k, \text{ or } 2k - 3 = 0 \Rightarrow k = \frac{3}{2}$$

Therefore, we can conclude that the value of k is $\frac{3}{2}$.

Q4. Factorize:

(i) $12x^2 - 7x + 1$

(ii) $2x^2 + 7x + 3$

(iii) $6x^2 + 5x - 6$

(iv) $3x^2 - x - 4$

Ans: (i) $12x^2 - 7x + 1$

$$\begin{aligned} 12x^2 - 7x + 1 &= 12x^2 - 3x - 4x + 1 \\ &= 3x(4x - 1) - 1(4x - 1) \\ &= (3x - 1)(4x - 1). \end{aligned}$$

Therefore, we conclude that on factorizing the polynomial $12x^2 - 7x + 1$, we get $(3x - 1)(4x - 1)$.

(ii) $2x^2 + 7x + 3$

$$\begin{aligned} 2x^2 + 7x + 3 &= 2x^2 + 6x + x + 3 \\ &= 2x(x + 3) + 1(x + 3) \\ &= (2x + 1)(x + 3). \end{aligned}$$

Therefore, we conclude that on factorizing the polynomial $2x^2 + 7x + 3$, we get $(2x + 1)(x + 3)$.

$$\text{(iii)} \quad 6x^2 + 5x - 6$$

$$6x^2 + 5x - 6 = 6x^2 + 9x - 4x - 6$$

$$= 3x(2x+3) - 2(2x+3)$$

$$= (3x-2)(2x+3).$$

Therefore, we conclude that on factorizing the polynomial $6x^2 + 5x - 6$, we get $(3x-2)(2x+3)$.

$$\text{(iv)} \quad 3x^2 - x - 4$$

$$3x^2 - x - 4 = 3x^2 + 3x - 4x - 4$$

$$= 3x(x+1) - 4(x+1)$$

$$= (3x-4)(x+1).$$

Therefore, we conclude that on factorizing the polynomial $3x^2 - x - 4$, we get $(3x-4)(x+1)$.

Q5. Factorize:

$$\text{(i)} \quad x^3 - 2x^2 - x + 2$$

$$\text{(ii)} \quad x^3 - 3x^2 - 9x - 5$$

$$\text{(iii)} \quad x^3 + 13x^2 + 32x + 20$$

$$\text{(iv)} \quad 2y^3 + y^2 - 2y - 1$$

$$\text{Ans: (i)} \quad x^3 - 2x^2 - x + 2$$

We need to consider the factors of 2, which are $\pm 1, \pm 2$.

Let us substitute 1 in the polynomial

$$x^3 - 2x^2 - x + 2, \text{ to get}$$

$$(1)^3 - 2(1)^2 - (1) + 2 = 1 - 1 - 1 + 2 = 0$$

Thus, according to factor theorem, we can

conclude that $(x-1)$ is a factor of the polynomial $x^3 - 2x^2 - x + 2$.

Let us divide the polynomial $x^3 - 2x^2 - x + 2$ by $(x-1)$, to get

$$\begin{array}{r}
 x^2 - x - 2 \\
 x-1 \overline{) x^3 - 2x^2 - x + 2} \\
 \underline{x^3 - x^2} \\
 -x^2 - x \\
 \underline{-x^2 + x} \\
 -2x + 2 \\
 \underline{-2x + 2} \\
 0
 \end{array}$$

$$x^3 - 2x^2 - x + 2 = (x-1)(x^2 - x - 2).$$

$$x^3 - 2x^2 - x + 2 = (x-1)(x^2 - x - 2).$$

$$= (x-1)(x^2 + x - 2x - 2)$$

$$= (x-1)[x(x+1) - 2(x+1)]$$

$$= (x-1)(x-2)(x+1).$$

Therefore, we can conclude that on factorizing the polynomial $x^3 - 2x^2 - x + 2$, we get $(x-1)(x-2)(x+1)$.

$$(ii) x^3 - 3x^2 - 9x - 5$$

We need to consider the factors of -5 , which are $\pm 1, \pm 5$.

Let us substitute 1 in the polynomial $x^3 - 3x^2 - 9x - 5$, to get

$$(-1)^3 - 3(-1)^2 - 9(-1) - 5 = -1 - 3 + 9 - 5 = 0$$

Thus, according to factor theorem, we can conclude that $(x+1)$ is a factor of the polynomial $x^3 - 3x^2 - 9x - 5$.

Let us divide the polynomial $x^3 - 3x^2 - 9x - 5$ by $(x+1)$, to get

$$\begin{array}{r}
 x^2 - 4x - 5 \\
 x+1 \overline{) x^3 - 3x^2 - 9x - 5} \\
 \underline{x^3 + x^2} \\
 -4x^2 - 9x \\
 \underline{-4x^2 - 4x} \\
 -5x - 5 \\
 \underline{-5x - 5} \\
 0
 \end{array}$$

$$\begin{aligned}
 x^3 - 3x^2 - 9x - 5 &= (x+1)(x^2 - 4x - 5) \\
 &= (x+1)(x^2 + x - 5x - 5) \\
 &= (x+1)[x(x+1) - 5(x+1)] \\
 &= (x+1)(x-5)(x+1).
 \end{aligned}$$

Therefore, we can conclude that on factorizing the polynomial $x^3 - 3x^2 - 9x - 5$, we get $(x+1)(x-5)(x+1)$.

(iii) $x^3 + 13x^2 + 32x + 20$

We need to consider the factors of 20, which are $\pm 5, \pm 4, \pm 2, \pm 1$.

Let us substitute -1 in the polynomial $x^3 + 13x^2 + 32x + 20$, to get

$$\begin{aligned}
 (-1)^3 + 13(-1)^2 + 32(-1) + 20 &= -1 + 13 - 32 + 20 = -20 + 20 = 0
 \end{aligned}$$

Thus, according to factor theorem, we can conclude that $(x+1)$ is a factor of the polynomial $x^3 + 13x^2 + 32x + 20$.

Let us divide the polynomial $x^3 + 13x^2 + 32x + 20$ by $(x+1)$, to get

$$\begin{array}{r}
 x^2+12x+20 \\
 x+1 \overline{) x^3+13x^2+32x+20} \\
 \underline{x^3+x^2} \\
 12x^2+32x \\
 \underline{12x^2+12x} \\
 20x+20 \\
 \underline{20x+20} \\
 0
 \end{array}$$

$$\begin{aligned}
 x^3+13x^2+32x+20 &= (x+1)(x^2+12x+20) \\
 &= (x+1)(x^2+2x+10x+20) \\
 &= (x+1)[x(x+2)+10(x+2)] \\
 &= (x+1)(x+10)(x+2).
 \end{aligned}$$

Therefore, we can conclude that on factorizing the polynomial $x^3+13x^2+32x+20$, we get $(x+1)(x+10)(x+2)$.

(iv) $2y^3+y^2-2y-1$

We need to consider the factors of -1, which are ± 1 .

Let us substitute 1 in the polynomial $2y^3+y^2-2y-1$, to get

$$2(1)^3+(1)^2-2(1)-1=2+1-2-1=3-3=0$$

Thus, according to factor theorem, we can conclude that $(y-1)$ is a factor of the polynomial $2y^3+y^2-2y-1$.

Let us divide the polynomial $2y^3+y^2-2y-1$ by $(y-1)$, to get

$$\begin{array}{r}
 2y^2 + 3y + 1 \\
 y-1 \overline{) 2y^3 + y^2 - 2y - 1} \\
 \underline{2y^3 - 2y^2} \\
 3y^2 - 2y \\
 \underline{3y^2 - 3y} \\
 y - 1 \\
 \underline{y - 1} \\
 0
 \end{array}$$

$$2y^3 + y^2 - 2y - 1 = (y-1)(2y^2 + 3y + 1)$$

$$= (y-1)(2y^2 + 2y + y + 1)$$

$$= (y-1)[2y(y+1) + 1(y+1)]$$

$$= (y-1)(2y+1)(y+1).$$

Therefore, we can conclude that on factorizing the polynomial $2y^3 + y^2 - 2y - 1$, we get

$$(y-1)(2y+1)(y+1)$$

***** END *****
