

### Operations on Whole Numbers Ex 4.5 Q1

**Answer :**

(i) 10<sup>th</sup> square number: A square number can easily be remembered by the following rule:

$$n^{\text{th}} \text{ square number} = n^2$$

$$\therefore 10^{\text{th}} \text{ square number} = 10^2 = 100$$

(ii) 6<sup>th</sup> triangular number: A triangular number can easily be remembered by the following rule:

$$n^{\text{th}} \text{ triangular number} = \frac{n \times (n+1)}{2}$$

$$\therefore 6^{\text{th}} \text{ triangular number} = \frac{6 \times (6+1)}{2} = 21$$

### Operations on Whole Numbers Ex 4.5 Q2

**Answer :**

(i) Yes, a rectangular number can also be a square number; for example, 16 is a square number and also a rectangular number.

(ii) Yes, there exists only one triangular number that is both a triangular number and a square number, and that number is 1.

### Operations on Whole Numbers Ex 4.5 Q3

**Answer :**

$$1 \times 5 = 5 \quad (5 - 1 = 4)$$

$$2 \times 6 = 12 \quad (6 - 2 = 4)$$

$$3 \times 7 = 21 \quad (7 - 3 = 4)$$

$$4 \times 8 = 32 \quad (8 - 4 = 4)$$

### Operations on Whole Numbers Ex 4.5 Q4

**Answer :**

$$9 \times 9 + 7 = 88$$

$$98 \times 9 + 6 = 888$$

$$987 \times 9 + 5 = 8888$$

$$9876 \times 9 + 4 = \underline{88888}$$

$$98765 \times 9 + 3 = \underline{888888}$$

$$987654 \times 9 + 2 = \underline{8888888}$$

$$9876543 \times 9 + 1 = \underline{88888888}$$
