

NCERT solutions for class 9 Maths Areas of Parallelograms and Triangles Ex 9.4

Q1. Parallelogram ABCD and rectangle ABEF are on the same base AB and have equal areas. Show that the perimeter of the parallelogram is greater than that of the rectangle.

Ans. Given: Parallelogram ABCD and rectangle ABEF are on same base AB and between the same parallels AB and CF.

$$\therefore \text{ar}(\parallel \text{gm } ABCD) = \text{ar}(\text{rect. } ABEF)$$

To prove: $AB + BC + CD + AD > AB + BE + EF + AF$

Proof: $AB = CD$ [\because opposites sides of a parallelogram are always equal]

$AB = EF$ [\because opposites sides of a rectangle are always equal]

$$\therefore CD = EF$$

Adding AB both sides,

$$AB + CD = AB + EF \dots\dots\dots(i)$$

\therefore Off all the segments that can be drawn to a given line from a point not lying on it, the perpendicular segment is the shortest.

$$\therefore BE < BC \text{ and } AF < AD$$

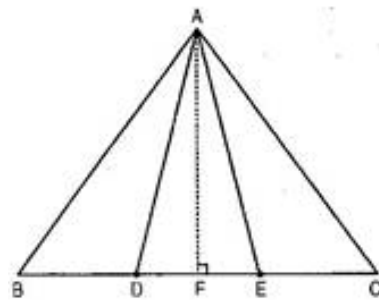

$$\Rightarrow BC > BE \text{ and } AD > AF$$

$$\therefore BC + AD > BE + AF \dots\dots\dots(ii)$$

From eq. (i) and (ii),

$$AB + CD + BC + AD = AB + EF + BE + AF$$

Q2. In figure, D and E are two points on BC such that $BD = DE = EC$. Show that $\text{ar}(\triangle ABD) = \text{ar}(\triangle ADE) = \text{ar}(\triangle AEC)$. Can you know answer the question that you have left in the 'introduction' of this chapter, whether the field of Budhia has been actually divided into three parts of equal area?

Ans. In $\triangle ABC$, points D and E divide BC in three equal parts such that $BD = DE = EC$.

$$\therefore BD = DE = EC = \frac{1}{3} BC$$

Draw $AF \perp BC$

$$\text{ar}(\triangle ABC) = \frac{1}{2} \times BC \times AF \dots\dots\dots(i)$$

$$\text{and ar}(\triangle ABD) = \frac{1}{2} \times BD \times AF \dots\dots\dots(ii)$$

$$= \frac{1}{2} \times \frac{BC}{3} \times AF = \frac{1}{3} \times \left[\frac{1}{2} \times BC \times AF \right]$$

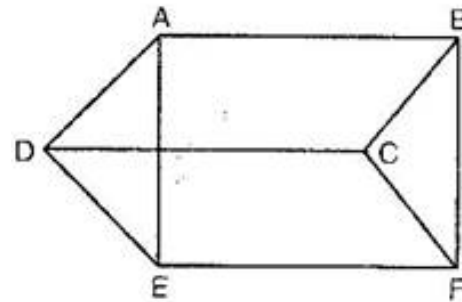

$$= \frac{1}{3} \text{ ar}(\triangle ABC) \dots\dots\dots(iii)$$

$$\text{And ar } (\triangle AEC) = \frac{1}{3} \text{ ar } (\triangle ABC) \dots\dots\dots(\text{iv})$$

From (ii), (iii) and (iv),

$$\text{ar } (\triangle ABD) = \text{ar } (\triangle ADE) = \text{ar } (\triangle AEC)$$

Q3. In figure, ABCD, DCFE and ABFE are parallelograms. Show that $\text{ar } (\triangle ADE) = \text{ar } (\triangle BCF)$.

Ans. As we know that opposite sides of a parallelogram are always equal.

\therefore In parallelogram ABFE, $AE = BF$ and $AB = EF$

In parallelogram DCFE, $DE = CF$ and $DC = EF$

In parallelogram ABCD, $AD = BC$ and $AB = DC$

Now in $\triangle ADE$ and $\triangle BCF$,

$AE = BF$ [Opposite sides of parallelogram ABFE]

$DE = CF$ [Opposite sides of parallelogram DCFE]

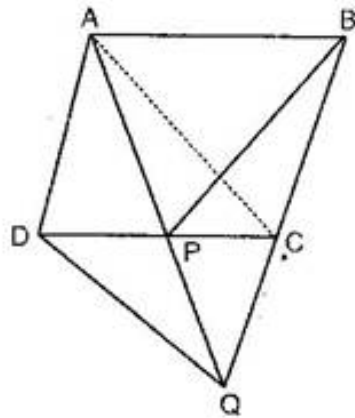

And $AD = BC$ [Opposite sides of parallelogram ABCD]

$\therefore \triangle ADE \cong \triangle BCF$ [By SSS congruency]

$\therefore \text{ar } (\triangle ADE) = \text{ar } (\triangle BCF)$

[\because Area of two congruent figures is always equal]

Q4. In figure, ABCD is a parallelogram and BC is produced to a point Q such that $AD = CQ$. If AQ intersects DC at P, show that $\text{ar}(\triangle BPC) = \text{ar}(\triangle DPQ)$.

Ans. Join A and C.

$\triangle APC$ and $\triangle BPC$ are on the same base PC and between the same parallels PC and AB.

$$\therefore \text{ar}(\triangle APC) = \text{ar}(\triangle BPC) \dots\dots\dots(i)$$

Now ACBD is a parallelogram.

$AD = BC$ [opposite sides of a parallelogram are always equal]

Also $BC = CQ$ [given]

$$\therefore AD = CQ$$

Now $AD \parallel CQ$ [Since CQ is the extension of BC]

And $AD = CQ$

$\therefore ADQC$ is a parallelogram.

[\because If one pair of opposite sides of a quadrilateral is equal and parallel then it is a parallelogram]

Since diagonals of a parallelogram bisect each other.

$$(iii) \text{ ar } (ABC) = 2 \text{ ar } (BEC)$$

$$(iv) \text{ ar } (BFE) = \text{ ar } (AFD)$$

$$(v) \text{ ar } (BFE) = 2 \text{ ar } (FED)$$

$$(vi) \text{ ar } (FED) = \frac{1}{8} \text{ ar } (AFC)$$

Ans. Join EC and AD.

Since $\triangle ABC$ is an equilateral triangle.

$$\therefore \angle A = \angle B = \angle C = 60^\circ$$

Also $\triangle BDE$ is an equilateral triangle.

$$\therefore \angle B = \angle D = \angle E = 60^\circ$$

If we take two lines, AC and BE and BC as a transversal.

$$\text{Then } \angle B = \angle C = 60^\circ \text{ [Alternate angles]}$$

$$\Rightarrow BE \parallel AC$$

Similarly, for lines AB and DE and BF as transversal.

$$\text{Then } \angle B = \angle C = 60^\circ \text{ [Alternate angles]}$$

$$\Rightarrow BE \parallel AC$$

$$(i) \text{ Area of equilateral triangle BDE} = \frac{\sqrt{3}}{4} (BD)^2$$

.....(i)

$$\text{Area of equilateral triangle ABC} = \frac{\sqrt{3}}{4} (BC)^2$$

.....(ii)

Dividing eq. (i) by (ii),

$$\frac{\text{ar}(\triangle BDE)}{\text{ar}(\triangle ABC)} = \frac{\frac{\sqrt{3}}{4}(BD)^2}{\frac{\sqrt{3}}{4}(BC)^2} \Rightarrow \frac{\text{ar}(\triangle BDE)}{\text{ar}(\triangle ABC)} = \frac{\frac{\sqrt{3}}{4}(BD)^2}{\frac{\sqrt{3}}{4}(2BD)^2}$$

$[\because BD = DC]$

$$\Rightarrow \frac{\text{ar}(\triangle BDE)}{\text{ar}(\triangle ABC)} = \frac{(BD)^2}{(2BD)^2} \Rightarrow \frac{\text{ar}(\triangle BDE)}{\text{ar}(\triangle ABC)} = \frac{1}{4}$$

$$\Rightarrow \text{ar}(\triangle BDE) = \frac{1}{4} \text{ar}(\triangle ABC)$$

(ii) In $\triangle BEC$, ED is the median.

$$\therefore \text{ar}(\triangle BEC) = \text{ar}(\triangle BAE) \dots\dots\dots(i)$$

[Median divides the triangle in two triangles having equal area]

Now $BE \parallel AC$

And $\triangle BEC$ and $\triangle BAE$ are on the same base BE and between the same parallels BE and AC .

$$\therefore \text{ar}(\triangle BEC) = \text{ar}(\triangle BAE) \dots\dots\dots(ii)$$

Using eq. (i) and (ii), we get

$$\text{Ar}(\triangle BDE) = \frac{1}{2} \text{ar}(\triangle BAE)$$

$$\text{(iii) We have } \text{ar}(\triangle BDE) = \frac{1}{4} \text{ar}(\triangle ABC)$$

[Proved in part (i)] $\dots\dots\dots(iii)$

$$\text{ar}(\triangle BDE) = \frac{1}{4} \text{ar}(\triangle BAE) \text{ [Proved in part (ii)]}$$

$$\text{ar}(\triangle BDE) = \frac{1}{4} \text{ar}(\triangle BEC) \text{ [Using eq. (iii)]}$$

.....(iv)

From eq. (iii) and (iv), we get

$$\frac{1}{4} \text{ar}(\triangle ABC) = \frac{1}{4} \text{ar}(\triangle BEC)$$

$$\Rightarrow \text{ar}(\triangle ABC) = 2 \text{ar}(\triangle BEC)$$

(iv) $\triangle BDE$ and $\triangle AED$ are on the same base DE and between same parallels AB and DE.

$$\therefore \text{ar}(\triangle BDE) = \text{ar}(\triangle AED)$$

Subtracting $\triangle FED$ from both the sides,

$$\text{ar}(\triangle BDE) - \text{ar}(\triangle FED) = \text{ar}(\triangle AED) - \text{ar}(\triangle FED)$$

$$\Rightarrow \text{ar}(\triangle BFE) = \text{ar}(\triangle AFD) \text{(v)}$$

(v) In an equilateral triangle, median drawn is also perpendicular to the side,

$$\therefore AD \perp BC$$

$$\text{Now ar}(\triangle AFD) = \frac{1}{2} \times FD \times AD \text{(vi)}$$

Draw $EG \perp BC$

$$\therefore \text{ar}(\triangle FED) = \frac{1}{2} \times FD \times EG \text{(vii)}$$

Dividing eq. (vi) by (vii), we get

$$\frac{\text{ar}(\triangle AFD) \times \frac{1}{2} \times FD \times AD}{\text{ar}(\triangle FED) \times \frac{1}{2} \times FD \times EG} \Rightarrow \frac{\text{ar}(\triangle AFD)}{\text{ar}(\triangle FED)} = \frac{AD}{EG}$$

$$\Rightarrow \frac{\text{ar}(\triangle AFD)}{\text{ar}(\triangle FED)} = \frac{\frac{\sqrt{3}}{4}BC}{\frac{\sqrt{3}}{4}BD} \quad [\text{Altitude of equilateral triangle} = \frac{\sqrt{3}}{4} \text{ side}]$$

$$\Rightarrow \frac{\text{ar}(\triangle AFD)}{\text{ar}(\triangle FED)} = \frac{2BD}{BD} \quad [D \text{ is the mid-point of } BC]$$

$$\Rightarrow \frac{\text{ar}(\triangle AFD)}{\text{ar}(\triangle FED)} = 2 \Rightarrow \text{ar}(\triangle AFD) = 2 \text{ ar}(\triangle FED)$$

.....(viii)

Using the value of eq. (viii) in eq. (v),

$$\text{Ar}(\triangle BFE) = 2 \text{ ar}(\triangle FED)$$

$$\text{(vi)} \quad \text{ar}(\triangle AFC) = \text{ar}(\triangle AFD) + \text{ar}(\triangle ADC) = 2 \text{ ar}(\triangle FED) + \frac{1}{2} \text{ ar}(\triangle ABC) \quad [\text{using (v)}]$$

$$= 2 \text{ ar}(\triangle FED) + \frac{1}{2} [4 \times \text{ar}(\triangle BDE)] \quad [\text{Using result of part (i)}]$$

$$= 2 \text{ ar}(\triangle FED) + 2 \text{ ar}(\triangle BDE) = 2 \text{ ar}(\triangle FED) + 2 \text{ ar}(\triangle AED)$$

$[\triangle BDE \text{ and } \triangle AED \text{ are on the same base and between same parallels}]$

$$= 2 \text{ ar}(\triangle FED) + 2 [\text{ar}(\triangle AFD) + \text{ar}(\triangle FED)]$$

$$= 2 \text{ ar}(\triangle FED) + 2 \text{ ar}(\triangle AFD) + 2 \text{ ar}(\triangle FED) \quad [\text{Using (viii)}]$$

$$= 4 \text{ ar}(\triangle FED) + 2 \text{ ar}(\triangle AFD)$$

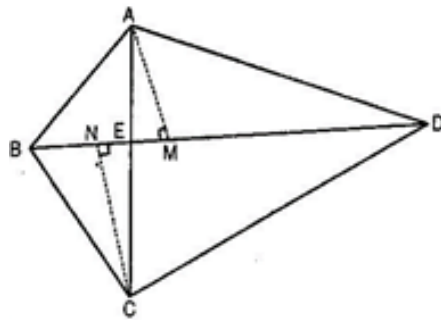

$$\Rightarrow \text{ar} (\triangle AFC) = 8 \text{ ar} (\triangle FED)$$

$$\Rightarrow \text{ar} (\triangle FED) = \frac{1}{8} \text{ ar} (\triangle AFC)$$

Q6. Diagonals AC and BD of a quadrilateral ABCD intersect each other at P. Show that:

$$\text{ar} (\triangle APB) \times \text{ar} (\triangle CPD) = \text{ar} (\triangle APD) \times \text{ar} (\triangle BPC)$$

Ans. Given: A quadrilateral ABCD, in which diagonals AC and BD intersect each other at point E.

To Prove: $\text{ar} (\triangle AED) \times \text{ar} (\triangle BEC)$

$$= \text{ar} (\triangle ABE) \times \text{ar} (\triangle CDE)$$

Construction: From A, draw $AM \perp BD$ and from C, draw $CN \perp BD$.

$$\text{Proof: } \text{ar} (\triangle ABE) = \frac{1}{2} \times BE \times AM \dots\dots\dots(i)$$

$$\text{And } \text{ar} (\triangle AED) = \frac{1}{2} \times DE \times AM \dots\dots\dots(ii)$$

Dividing eq. (ii) by (i), we get,

$$\frac{\text{ar}(\triangle AED)}{\text{ar}(\triangle ABE)} = \frac{\frac{1}{2} \times DE \times AM}{\frac{1}{2} \times BE \times AM} \Rightarrow \frac{\text{ar}(\triangle AED)}{\text{ar}(\triangle ABE)} = \frac{DE}{BE}$$

.....(iii)

$$\text{Similarly } \frac{\text{ar}(\triangle CDE)}{\text{ar}(\triangle BEC)} = \frac{DE}{BE} \text{(iv)}$$

From eq. (iii) and (iv), we get

$$\frac{\text{ar}(\triangle AED)}{\text{ar}(\triangle ABE)} = \frac{\text{ar}(\triangle CDE)}{\text{ar}(\triangle BEC)}$$

$$\Rightarrow \text{ar}(\triangle AED) \times \text{ar}(\triangle BEC) = \text{ar}(\triangle ABE) \times \text{ar}(\triangle CDE)$$

Hence proved.

Q7. P and Q are respectively the mid-points of sides AB and BC of a triangle ABC and R is the mid-point of AP, show that:

$$(i) \text{ ar}(\triangle PRQ) = \frac{1}{2} \text{ ar}(\triangle ARC)$$

$$(ii) \text{ ar}(\triangle RQC) = \frac{3}{8} \text{ ar}(\triangle ABC)$$

$$(iii) \text{ ar}(\triangle PBQ) = \text{ar}(\triangle ARC)$$

Ans. (i) PC is the median of $\triangle ABC$.

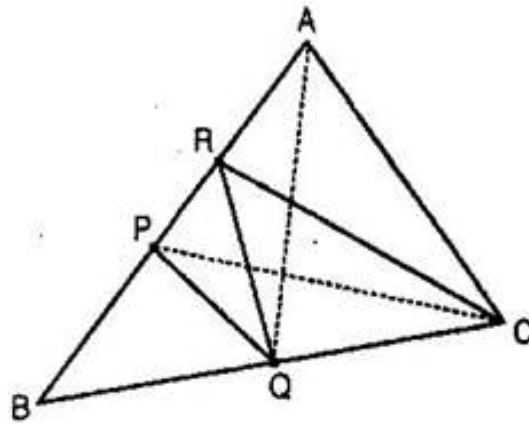

$$\therefore \text{ar}(\triangle BPC) = \text{ar}(\triangle APC) \text{(i)}$$

RC is the median of $\triangle APC$.

$$\therefore \text{ar}(\triangle ARC) = \frac{1}{2} \text{ar}(\triangle APC) \dots\dots\dots(\text{ii})$$

[Median divides the triangle into two triangles of equal area]

PQ is the median of $\triangle BPC$.

$$\therefore \text{ar}(\triangle PQC) = \frac{1}{2} \text{ar}(\triangle BPC) \dots\dots\dots(\text{iii})$$

From eq. (i) and (iii), we get,

$$\text{ar}(\triangle PQC) = \frac{1}{2} \text{ar}(\triangle APC) \dots\dots\dots(\text{iv})$$

From eq. (ii) and (iv), we get,

$$\text{ar}(\triangle PQC) = \text{ar}(\triangle ARC) \dots\dots\dots(\text{v})$$

We are given that P and Q are the mid-points of AB and BC respectively.

$$\therefore PQ \parallel AC \text{ and } PA = \frac{1}{2} AC$$

$$\Rightarrow \text{ar}(\triangle APQ) = \text{ar}(\triangle PQC) \dots\dots\dots(\text{vi}) \text{ [triangles between same parallel are equal in area]}$$

From eq. (v) and (vi), we get

$$\text{ar} (\Delta APQ) = \text{ar} (\Delta ARC) \dots\dots\dots(\text{vii})$$

R is the mid-point of AP. Therefore RQ is the median of ΔAPQ .

$$\therefore \text{ar} (\Delta PRQ) = \frac{1}{2} \text{ar} (\Delta APQ) \dots\dots\dots(\text{viii})$$

From (vii) and (viii), we get,

$$\text{ar} (\Delta PRQ) = \frac{1}{2} \text{ar} (\Delta ARC)$$

(ii) PQ is the median of ΔBPC

$$\begin{aligned} \therefore \text{ar} (\Delta PQC) &= \frac{1}{2} \text{ar} (\Delta BPC) = \frac{1}{2} \times \frac{1}{2} \text{ar} (\Delta ABC) \\ &= \frac{1}{4} \text{ar} (\Delta ABC) \dots\dots\dots(\text{ix}) \end{aligned}$$

$$\text{Also ar} (\Delta PRC) = \frac{1}{2} \text{ar} (\Delta APC) \text{ [Using (iv)]}$$

$$\begin{aligned} \Rightarrow \text{ar} (\Delta PRC) &= \frac{1}{2} \times \frac{1}{2} \text{ar} (\Delta ABC) = \frac{1}{4} \text{ar} (\Delta ABC) \\ &\dots\dots\dots(\text{x}) \end{aligned}$$

Adding eq. (ix) and (x), we get,

$$\text{ar} (\Delta PQC) + \text{ar} (\Delta PRC) = \left(\frac{1}{4} + \frac{1}{4} \right) \text{ar} (\Delta ABC)$$

$$\Rightarrow \text{ar} (\text{quad. PQCR}) = \frac{1}{2} \text{ar} (\Delta ABC) \dots\dots\dots(\text{xi})$$

Subtracting $\text{ar} (\Delta PRQ)$ from the both sides,

$$\text{ar} (\text{quad. PQCR}) - \text{ar} (\Delta PRQ) = \frac{1}{2} \text{ar} (\Delta ABC) -$$

$$\text{ar} (\Delta \text{PRQ})$$

$$\Rightarrow \text{ar} (\Delta \text{RQC}) = \frac{1}{2} \text{ar} (\Delta \text{ABC}) - \frac{1}{2} \text{ar} (\Delta \text{ARC})$$

[Using result (i)]

$$\Rightarrow \text{ar} (\Delta \text{ARC}) = \frac{1}{2} \text{ar} (\Delta \text{ABC}) - \frac{1}{2} \times \frac{1}{2} \text{ar} (\Delta \text{APC})$$

$$\Rightarrow \text{ar} (\Delta \text{RQC}) = \frac{1}{2} \text{ar} (\Delta \text{ABC}) - \frac{1}{4} \text{ar} (\Delta \text{APC})$$

$$\Rightarrow \text{ar} (\Delta \text{RQC}) = \frac{1}{2} \text{ar} (\Delta \text{ABC}) - \frac{1}{4} \times \frac{1}{2} \text{ar} (\Delta \text{ABC}) \text{ [PC is median of } \Delta \text{ABC]}$$

$$\Rightarrow \text{ar} (\Delta \text{RQC}) = \frac{1}{2} \text{ar} (\Delta \text{ABC}) - \frac{1}{8} \text{ar} (\Delta \text{ABC})$$

$$\Rightarrow \text{ar} (\Delta \text{RQC}) = \left(\frac{1}{2} - \frac{1}{8} \right) \times \text{ar} (\Delta \text{ABC})$$

$$\Rightarrow \text{ar} (\Delta \text{RQC}) = \frac{3}{8} \text{ar} (\Delta \text{ABC})$$

$$\text{(iii) } \text{ar} (\Delta \text{PRQ}) = \frac{1}{2} \text{ar} (\Delta \text{ARC}) \text{ [Using result (i)]}$$

$$\Rightarrow 2 \text{ar} (\Delta \text{PRQ}) = \text{ar} (\Delta \text{ARC}) \text{ ..(xii)}$$

$$\text{ar} (\Delta \text{PRQ}) = \frac{1}{2} \text{ar} (\Delta \text{APQ}) \text{ [RQ is the median of } \Delta \text{APQ]} \text{(xiii)}$$

$$\text{But } \text{ar} (\Delta \text{APQ}) = \text{ar} (\Delta \text{PQC}) \text{ [Using reason of eq. (vi)](xiv)}$$

From eq. (xiii) and (xiv), we get,

$$\text{ar}(\triangle PRQ) = \frac{1}{2} \text{ar}(\triangle PQC) \dots\dots\dots(\text{xv})$$

But $\text{ar}(\triangle BPQ) = \text{ar}(\triangle PQC)$ [PQ is the median of $\triangle BPC$] $\dots\dots\dots(\text{xvi})$

From eq. (xv) and (xvi), we get,

$$\text{ar}(\triangle PRQ) = \frac{1}{2} \text{ar}(\triangle BPQ) \dots\dots\dots(\text{xvii})$$

Now from (xii) and (xvii), we get,

$$2\left(\frac{1}{2} \text{ar}(\triangle BPQ)\right) = \text{ar}(\triangle ARC) \Rightarrow \text{ar}(\triangle BPQ) = \text{ar}(\triangle ARC)$$

Q8. In figure, ABC is a right triangle right angled at A. BCED, ACFG and ABMN are squares on the sides BC, CA and AB respectively. Line segment $AX \perp DE$ meets BC at Y. Show that:

- (i) $\triangle MBC \cong \triangle ABD$
- (ii) $\text{ar}(\text{BYXD}) = 2 \text{ar}(\text{MBC})$
- (iii) $\text{ar}(\text{BYXD}) = \text{ar}(\text{ABMN})$
- (iv) $\triangle FCB \cong \triangle ACE$
- (v) $\text{ar}(\text{CYXE}) = 2 \text{ar}(\text{FCB})$
- (vi) $\text{ar}(\text{CYXE}) = \text{ar}(\text{ACFG})$
- (vii) $\text{ar}(\text{BCED}) = \text{ar}(\text{ABMN}) + \text{ar}(\text{ACFG})$

$$\Rightarrow \text{ar} (\triangle MBC) = \frac{1}{2} BD \cdot BY + \frac{1}{2} AX (BY - DX)$$

$$\Rightarrow \text{ar} (\triangle MBC) = \frac{1}{2} BD \cdot BY + \frac{1}{2} AX \cdot 0 [BY = DX]$$

$$\Rightarrow \text{ar} (\triangle MBC) = \frac{1}{2} BD \cdot BY$$

$$\Rightarrow 2 \text{ar} (\triangle MBC) = BD \cdot BY \Rightarrow 2 \text{ar} (\triangle MBC) = \text{ar} (\text{rect. BYXD})$$

$$\text{Hence ar (BYXD) = 2 ar (}\triangle MBC\text{)}$$

(iii) Join AM. ABMN is a square.

Therefore, NA \parallel MB \Rightarrow AC \parallel MB

Now $\triangle AMB$ and $\triangle MBC$ are on the same base and between the same parallels MB and AC.

$$\therefore \text{ar} (\triangle AMB) = \text{ar} (\triangle MBC) \dots\dots\dots\text{(ii)}$$

$$\text{From result (ii), we have ar (BYXD) = 2 ar (}\triangle MBC\text{) } \dots\dots\dots\text{(iii)}$$

Using eq. (ii) and (iii), we get, $\text{ar (BYXD) = 2 ar (}\triangle AMB\text{)}$

$$\Rightarrow \text{ar (BYXD) = ar (square ABMN)}$$

[Diagonal AM of square ABMN divides it in two triangles of equal area]

(iv) In $\triangle FCB$ and $\triangle ACE$,

$$FC = AC \text{ [sides of square ACFG]}$$

$$BC = CE \text{ [sides of square BCED]}$$

$$\angle BCF = \angle ACE \text{ [}\because \angle ACF = \angle BCE = 90^\circ\text{]}$$

Adding $\angle ACB$ both sides,

$$\angle BCF + \angle ACB = \angle ACE + \angle ACB \Rightarrow \angle BCF = \angle ACE$$

$\therefore \triangle FCB \cong \triangle ACE$ [By SAS congruency]

(v) From (iv), we have, $\triangle FCB \cong \triangle ACE$

$$\Rightarrow \text{ar}(\triangle FCB) = \text{ar}(\triangle ACE) \Rightarrow \text{ar}(\triangle FCB) = \text{ar}(\text{trap. ACXY}) - \text{ar}(\triangle AEX)$$

$$\Rightarrow \text{ar}(\triangle FCB) = \frac{1}{2} (CE + AX) CY - \frac{1}{2} XE \cdot AX$$

$$\Rightarrow \text{ar}(\triangle FCB) = \frac{1}{2} CE \cdot CY + \frac{1}{2} AX \cdot CY - \frac{1}{2}$$

$$XE \cdot AX$$

$$\Rightarrow \text{ar}(\triangle FCB) = \frac{1}{2} CE \cdot CY + \frac{1}{2} AX (CY - XE)$$

$$\Rightarrow \text{ar}(\triangle FCB) = \frac{1}{2} CE \cdot CY + \frac{1}{2} AX \cdot 0 \quad [CY = XE]$$

$$\Rightarrow \text{ar}(\triangle FCB) = \frac{1}{2} CE \cdot CY$$

$$\Rightarrow 2 \text{ar}(\triangle FCB) = CE \cdot CY \Rightarrow 2 \text{ar}(\triangle FCB) = \text{ar}(\text{rect. CYXE})$$

$$\text{Hence ar}(\text{BYXD}) = 2 \text{ar}(\triangle FCB)$$

(vi) Join AF. ACFG is a square.

$$\therefore FC \parallel AG \Rightarrow FC \parallel AB$$

Now $\triangle ACF$ and $\triangle FCB$ are on the same base FC and between the same parallels FC and AB.

$$\therefore \text{ar}(\triangle ACF) = \text{ar}(\triangle FCB) \dots\dots\dots(v)$$

$$\text{From result (v), we get, ar}(\text{CYXE}) = 2 \text{ar}(\triangle FCB) \dots\dots\dots(vi)$$

$$\text{Using eq. (v) in (vi), we get, ar}(\text{CYXE}) = 2 \text{ar}(\triangle ACF)$$

Diagonal AF of square ACFG divides it in two triangles of equal area.

$$\therefore \text{ar}(\text{CYXE}) = \text{ar}(\text{sq. ACFG}) \dots\dots\dots(vii)$$

(vii) Adding eq. (iv) and (vii), we get,

$$\text{ar}(\text{BYXD}) + \text{ar}(\text{CYXE}) = \text{ar}(\text{ABMN}) + \text{ar}(\text{ACFG})$$

$$\Rightarrow \text{ar}(\text{BCED}) = \text{ar}(\text{ABMN}) + \text{ar}(\text{ACFG})$$

*****END*****
