

QUESTIONS FROM TEXTBOOK

Question 2. 1. Fill in the blanks

- (a) The volume of a cube of side 1 cm is equal to.....m³.
 (b) The surface area of a solid cylinder of radius 2.0 cm and height 10.0 cm is equal to(mm)².
 (c) A vehicle moving with a speed of 18 km h⁻¹ covers m in 1 s.
 (d) The relative density of lead is 11.3. Its density is g cm⁻³ or kg m⁻³.

Answer:

(a) Volume of cube, $V = (1 \text{ cm})^3 = (10^{-2} \text{ m})^3 = 10^{-6} \text{ m}^3$.

Hence, answer is 10⁻⁶

(b) Surface area = $2\pi rh + 2\pi r^2 = 2\pi r(h + r)$
 $= 2 \times 22/7 \times 2 \times 10 (10 \times 10 + 2 \times 10) \text{ mm}^2$
 $= 1.5 \times 10^4 \text{ mm}^2$

Hence, answer is 1.5×10^4 .

(c) Speed of vehicle = 18 km/h
 $= 18 \times 1000/3600 \text{ m/s}$
 $= 5 \text{ m/s};$

so the vehicle covers 5 m in 1 s. = 11.3

(d) Density = 11.3 g cm^{-3}
 $= 11.3 \times 10^3 \text{ kg m}^{-3} [1 \text{ kg} = 10^3 \text{ g}, 1 \text{ m} = 10^2 \text{ cm}]$
 $= 11.3 \times 10^3 \text{ kg m}^{-3}$

Question 2. 2. Fill in the blanks by suitable conversion of units

- (a) $1 \text{ kg m}^2 \text{ s}^{-2} = \dots \text{ g cm}^2 \text{ s}^{-2}$
 (b) $1 \text{ m} = \dots \text{ ly}$
 (c) $3.0 \text{ m s}^{-2} = \dots \text{ km h}^{-2}$
 (d) $G = 6.67 \times 10^{-11} \text{ N m}^2 (\text{kg})^{-2} = \dots (\text{cm})^3 \text{ s}^{-2} \text{ g}^{-1}$.

Answer:

(a) $1 \text{ kg m}^2 \text{ s}^{-2} = \frac{1 \text{ kg m}^2}{\text{s}^2} = \frac{1 \times 1000 \times (10^2)^2}{\text{s}^2} \text{ g cm}^2$
 $= 10^7 \text{ g cm}^2 \text{ s}^{-2}$

(b) $1 \text{ m} = \frac{1}{9.46 \times 10^{15}} \text{ ly} \approx \frac{1}{10^{16}} \text{ ly} = 10^{-16} \text{ ly}$

(c) $3 \text{ ms}^{-2} = \frac{3 \times 10^{-3} \text{ km}}{\left(\frac{1}{3600}\right)^2 \text{ h}^2} = 3 \times 3600 \times 3600 \times 10^{-3} \text{ km h}^{-2}$
 $= 3.888 \times 10^4 \text{ km h}^{-2}$

(d) $G = 6.67 \times 10^{-11} \text{ Nm}^2 \text{ kg}^{-2} = 6.67 \times 10^{-11} \frac{\text{kg m}}{\text{s}^2} \text{ m}^2 \text{ kg}^{-2}$
 $= 6.67 \times 10^{-11} \text{ kg}^{-1} \text{ m}^3 \text{ s}^{-2}$
 $= 6.67 \times 10^{-11} \frac{\text{m}^3}{\text{kg s}^2} = \frac{6.67 \times 10^{-11} \times (10^2)^3}{(10^3)^2}$
 $= 6.67 \times 10^{-8} \text{ cm}^3 \text{ s}^{-2} \text{ g}^{-1}$.

Question 2. 3. A calorie is a unit of heat or energy and it equals about 4.2 J where $1 \text{ J} = 1 \text{ kg m}^2 \text{ s}^{-2}$. Suppose we employ a system of

units in which the unit of mass equals α kg, the unit of length equals β m, the unit of time is γ s. Show that a calorie has a magnitude

4.2 $\alpha^{-1} \beta^{-2} \gamma^2$ in terms of the new units.

Answer:

$$1 \text{ cal} = 4.2 \text{ kg m}^2 \text{ s}^{-2}$$

SI	New system
$n_1 = 4.2$	$n_2 = ?$
$M_1 = 1 \text{ kg}$	$M_2 = \alpha \text{ kg}$
$L_1 = 1 \text{ m}$	$L_2 = \beta \text{ m}$
$T_1 = 1 \text{ s}$	$T_2 = \gamma \text{ second}$

Dimensional formula of energy is $[M^1 L^2 T^{-2}]$

Comparing with $[M^a L^b T^c]$, we get

$$a = 1, \quad b = 2, \quad c = -2$$

$$\begin{aligned} \text{Now,} \quad n_2 &= n_1 \left[\frac{M_1}{M_2} \right]^a \left[\frac{L_1}{L_2} \right]^b \left[\frac{T_1}{T_2} \right]^c \\ &= 4.2 \left[\frac{1 \text{ kg}}{\alpha \text{ kg}} \right]^1 \left[\frac{1 \text{ m}}{\beta \text{ m}} \right]^2 \left[\frac{1 \text{ s}}{\gamma \text{ s}} \right]^{-2} \end{aligned}$$

$$\text{or,} \quad n_2 = 4.2 \alpha^{-1} \beta^{-2} \gamma^2.$$

Question 2. 4. Explain this statement clearly:

"To call a dimensional quantity 'large' or 'small' is meaningless without specifying a standard for comparison". In view of this, reframe the following statements wherever necessary:

- atoms are very small objects
- a jet plane moves with great speed
- the mass of Jupiter is very large
- the air inside this room contains a large number of molecules
- a proton is much more massive than an electron
- the speed of sound is much smaller than the speed of light.

Answer:

Physical quantities are called large or small depending on the unit (standard) of measurement. For example, the distance between two cities on earth is measured in kilometres but the distance between stars or intergalactic distances are measured in parsec. The later standard parsec is equal to 3.08×10^{16} m or 3.08×10^{12} km is certainly larger than metre or kilometre. Therefore, the inter-stellar or intergalactic distances are certainly larger than the distances between two cities on earth.

- The size of an atom is much smaller than even the sharp tip of a pin.
- A Jet plane moves with a speed greater than that of a super fast train.
- The mass of Jupiter is very large compared to that of the earth.
- The air inside this room contains more number of molecules than in one mole of air.
- This is a correct statement.
- This is a correct statement.

Question 2. 5. A new unit of length is chosen such that the speed of light in vacuum is unity. What is the distance between the Sun and the Earth in terms of the new unit if light takes 8 min and 20 s to

cover this distance?

Answer: Distance between Sun and Earth

= Speed of light in vacuum \times time taken by light to travel from Sun to Earth

$$= 3 \times 10^8 \text{ m/s} \times 8 \text{ min } 20 \text{ s}$$

$$= 3 \times 10^8 \text{ m/s} \times 500 \text{ s}$$

$$= 500 \times 3 \times 10^8 \text{ m.}$$

In the new system, the speed of light in vacuum is unity. So, the new unit of length is $3 \times 10^8 \text{ m}$.

\therefore distance between Sun and Earth = 500 new units.

Question 2.6. Which of the following is the most precise device for measuring length:

(a) a vernier callipers with 20 divisions on the sliding scale.

(b) a screw gauge of pitch 1 mm and 100 divisions on the circular scale.

(c) an optical instrument that can measure length to within a wavelength of light?

Answer:

(a) Least count of vernier callipers = $1/20 = 0.05 \text{ mm} = 5 \times 10^{-5} \text{ m}$

(b) Least count of screw gauge = Pitch/No. of divisions on circular scale = $1 \times 10^{-3}/100 = 1 \times 10^{-5} \text{ m}$

(c) Least count of optical instrument = 6000 \AA (average wavelength of visible light as 6000 \AA) = $6 \times 10^{-7} \text{ m}$ As the least count of optical instrument is least, it is the most precise device out of three instruments given to us.

Question 2.7. A student measures the thickness of a human hair by looking at it through a microscope of magnification 100. He makes 20 observations and finds that the average width of the hair in the field of view of the microscope is 3.5 mm. What is the estimate on the thickness of hair?

Answer: As magnification, m = thickness of image of hair/ real thickness of hair = 100

and average width of the image of hair as seen by microscope = 3.5 mm

\therefore Thickness of hair = $3.5 \text{ mm}/100 = 0.035 \text{ mm}$

Question 2.8. Answer the following:

(a) You are given a thread and a metre scale. How will you estimate the diameter of the thread ?

(b) A screw gauge has a pitch of 1.0 mm and 200 divisions on the circular scale. Do you think it is possible to increase the accuracy of the screw gauge arbitrarily by increasing the number of divisions on the circular scale?

(c) The mean diameter of a thin brass rod is to be measured by vernier callipers. Why is a set of 100 measurements of the diameter expected to yield a more reliable estimate than a set of 5 measurements only?

Answer:

(a) Wrap the thread a number of times on a round pencil so as to form a coil having its turns touching each other closely. Measure the length of this coil, made by the thread, with a metre scale. If n be the number of turns of the coil and l be the length of the coil, then the length occupied by each single turn i.e., the thickness of the thread = l/n .

This is equal to the diameter of the thread.

(b) We know that least count = Pitch/number of divisions on circular scale When number of divisions on circular scale is increased, least count is decreased. Hence the accuracy is increased. However, this is only a theoretical idea. Practically speaking, increasing the number of 'turns' would create many difficulties.

As an example, the low resolution of the human eye would make observations difficult. The nearest divisions would not clearly be

distinguished as separate. Moreover, it would be technically difficult to maintain uniformity of the pitch of the screw throughout its length.

(c) Due to random errors, a large number of observation will give a more reliable result than smaller number of observations. This is due to the fact that the probability (chance) of making a positive random error of a given magnitude is equal to that of making a negative random error of the same magnitude. Thus in a large number of observations, positive and negative errors are likely to cancel each other. Hence more reliable result can be obtained.

Question 2. 9. The photograph of a house occupies an area of 1.75 cm^2 on a 35 mm slide. The slide is projected on to a screen, and the area of the house on the screen is 1.55 m^2 . What is the linear magnification of the projector-screen arrangement?

Answer: Here area of the house on slide = $1.75 \text{ cm}^2 = 1.75 \times 10^{-4} \text{ m}^2$ and area of the house of projector-screen = 1.55 m^2

\therefore Areal magnification = Area on screen / Area on slide = $1.55 \text{ m}^2 / 1.75 \times 10^{-4} \text{ m}^2 = 8.857 \times 10^3$

\therefore Linear magnification

$$= \sqrt{\text{Areal magnification}}$$

$$= \sqrt{(8.857) \times 10^3}$$

$$= 94.1.$$

Question 2. 10. State the number of significant figures in the following:

(a) 0.007 m^2

(b) $2.64 \times 10^4 \text{ kg}$

(c) 0.2370 g cm^{-3}

(d) 6.320 J

(e) 6.032 N m^{-2}

(f) 0.0006032 m^2

Answer:

(a) 1 (b) 3 (c) 4 (d) 4 (e) 4 (f) 4.
