

Circles Ex 16.5 Q16

Answer :

It is given that $\angle A - \angle C = 60^\circ$ and $ABCD$ is cyclic quadrilateral

We have to prove that smaller of two is 60°

Since $ABCD$ is cyclic quadrilateral

So $\angle A + \angle C = 180^\circ$ (by cyclic quadrilateral property) (1)

And

$\angle A - \angle C = 60^\circ$ (Given) (2)

Adding equation (1) and (2) we have

$$2\angle A = 240^\circ$$

$$\begin{aligned}\angle A &= \frac{240^\circ}{2} \\ &= 120^\circ\end{aligned}$$

So $\angle C = 60^\circ$

Hence smaller of two is 60° proved.

Circles Ex 16.5 Q17

Answer :

Here, ABCD is a cyclic quadrilateral, we need to find x.

In cyclic quadrilateral the sum of opposite angles is equal to 180° .

Therefore,

$$\angle ADC + \angle ABC = 180$$

$$\Rightarrow 180 - 80 + 180 - x = 180$$

$$\Rightarrow x = 100^\circ$$

Hence, the value of x is 100° .
