

### Exercise 11B

Question 1:

If  $T_1, T_2, T_3$  are consecutive terms of an AP, then

$$T_2 - T_1 = T_3 - T_2 \text{ or } 2T_2 = T_1 + T_3$$

$\therefore x+2, 2x, 2x+3$  are in AP, if

$$2(2x) = x+2 + 2x+3$$

$$\Rightarrow 4x = 3x + 5 \Rightarrow x = 5$$

Question 2:

Let the required numbers be  $(a-d)$ ,  $a$  and  $(a+d)$

$$\text{Sum of these numbers} = (a-d) + a + (a+d) = 3a$$

$$\text{Product of these numbers} = (a-d) \times a \times (a+d) = a(a^2 - d^2)$$

But sum = 15 and product = 80

$$\therefore 3a = 15 \Rightarrow a = 5$$

$$\text{and } a(a^2 - d^2) = 5 \times (25 - d^2) = 80 \quad [\because a = 5]$$

$$\Rightarrow (25 - d^2) = 16$$

$$\Rightarrow d^2 = 25 - 16 \Rightarrow d^2 = 9$$

$$\Rightarrow d = 3$$

Thus,  $a = 5$  and  $d = 3$

Hence, the required numbers are (2, 5, 8)

Question 3:

Let the required number be  $(a-d)$ ,  $a$  and  $(a+d)$

$$\text{Sum of these numbers} = (a-d) + a + (a+d) = 3a$$

$$\text{Product of these numbers} = (a-d) \times a \times (a+d) = a(a^2 - d^2)$$

But sum = 27 and product = 405

$$\therefore 3a = 27 \Rightarrow a = 9$$

$$\text{and } a(a^2 - d^2) = 405$$

$$\Rightarrow 9 \times (81 - d^2) = 405 \quad [\because a = 9]$$

$$\Rightarrow 729 - 9d^2 = 405$$

$$\Rightarrow 9d^2 = 729 - 405 = 324$$

$$\Rightarrow d^2 = 36$$

$$d = \pm 6$$

$$a = 9 \text{ and } d = 6$$

Hence the required numbers are (3, 9, 15)

Question 4:

Let the required numbers be  $(a-d)$ ,  $a$ ,  $(a+d)$

$$\text{Sum of these number} = (a-d) + a + (a+d) = 3a$$

$$\text{Product of these numbers} = (a-d) \times a \times (a+d) = a(a^2 - d^2)$$

$$\therefore 3a = 3 \Rightarrow a = 1$$

$$\text{and } a(a^2 - d^2) = 1(1 - d^2) = -35$$

$$\Rightarrow 1 - d^2 = -35$$

$$\Rightarrow d^2 = 36$$

$$\Rightarrow d = 6$$

But, sum = 3 and product = - 35

Thus,  $a = 1$  and  $d = 6$

Hence, the required numbers are (-5, 1, 7)

\*\*\*\*\* END \*\*\*\*\*
