

Mathematical Induction Ex 12.2 Q44

$$S_n = 1^2 + 2 \times 2^2 + 3^2 + 2 \times 4^2 + \dots$$

Using induction we first show this is true for  $n=2$ ,

$$\text{we get } S_2 = 1^2 + 2 \times 2^2 = 1 + 8 = 9$$

From RHS, we have if  $n$  is even  $S_n = \frac{n(n+1)^2}{2}$

$$S_2 = \frac{2 \times 9}{2} = 9$$

Now using induction we first show this is true also

$$\text{for } n=3, \text{ we get } S_3 = 1 + 8 + 9 = 18$$

From RHS, we have if  $n$  is odd  $S_n = \frac{n^2(n+1)}{2}$

$$S_3 = \frac{9 \times 4}{2} = 18$$

Lets assume above is true for  $n=k$ , we get

$$k \text{ is even, } S_k = 1^2 + 2 \times 2^2 + 3^2 + 2 \times 4^2 + \dots + 2 \times k^2 \text{ ---1}$$

$$k \text{ is odd, } S_k = 1^2 + 2 \times 2^2 + 3^2 + 2 \times 4^2 + \dots + k^2 \text{ ----2}$$

Now lets prove for  $n=k+1$

If  $k$  is even,  $k+1$  is odd we get

$$S_{k+1} = 1^2 + 2 \times 2^2 + 3^2 + \dots + 2 \times k^2 + (k+1)^2 \text{ ----3}$$

From above relation, we get

$$S_k = 1^2 + 2 \times 2^2 + 3^2 + 2 \times 4^2 + \dots + 2 \times k^2 = \frac{k(k+1)^2}{2}$$

Substitute this in 3, we get

$$S_{k+1} = \frac{k(k+1)^2}{2} + (k+1)^2 = \frac{(k+1)^2(k+2)}{2}$$

= RHS (when ' $k+1$ ' is odd)

Hence Proved

Mathematical Induction Ex 12.2 Q45

Let  $P(n)$  be the statement given by

$P(n)$ : The number of subsets of a set containing  $n$  distinct elements is  $2^n$   
for all  $n \in \mathbb{N}$ .

Step I:

$$P(1): 2^1 = 2$$

For any set  $A$  containing 1 element, empty set and set  $A$  are two sets always subsets of  $A$ .

$\therefore P(1)$  is true.

Step II:

Let  $P(m)$  is true. Then,

A set containing  $m$  distinct elements has  $2^m$  subsets.....(i)

We have to prove that  $P(m+1)$  is true.

Let the set  $A$  has  $(m+1)$  elements.

$$A = \{1, 2, \dots, m, m+1\}$$

$$A = \{1, 2, \dots, m\} \cup \{m+1\}$$

Now using (i) we can say that  $\{1, 2, \dots, m\}$  being  $m$  elements has  $2^m$  subsets.

For  $\{m+1\}$ , empty set and set itself  $\{m+1\}$  are subsets.

So,  $\{m+1\}$  has 2 subsets.

$\Rightarrow$  Set  $A$  has  $2^m + 2$  subsets

$\Rightarrow$  Set  $A$  has  $2^{m+1}$  subsets

$\Rightarrow P(m+1)$  is true.

Hence by the principle of mathematical induction, the given result is true for all  $n \in \mathbb{N}$ .

### Mathematical Induction Ex 12.2 Q46

Let  $P(n)$  be the statement given by

$P(n): a_n = 3 \times 7^{n-1}$  for all  $n \in \mathbb{N}$ .

Step I:

$$P(2): a_2 = 3 \times 7^{2-1} = 21$$

Given that  $a_k = 7 a_{k-1}$  for all natural numbers  $k \geq 2$

$$a_2 = 7 a_1 = 7 \times 3 = 21$$

$\therefore P(2)$  is true.

Step II:

Let  $P(m)$  is true. Then,

$$a_m = 3 \times 7^{m-1} \dots \dots \dots (i)$$

We have to prove that  $P(m+1)$  is true.

$$a_{m+1} = 7 a_m$$

$$a_{m+1} = 7 \times a_m$$

$$a_{m+1} = 7^1 \times 3 \times 7^{m-1} \dots \dots \dots [\text{from (i)}]$$

$$a_{m+1} = 3 \times 7^{m-1+1}$$

$$a_{m+1} = 3 \times 7^m$$

$\Rightarrow P(m+1)$  is true.

Hence by the principle of mathematical induction, the given result is true for all  $n \in \mathbb{N}$ .
