

### Exercise 3C

Question 1:

$$x + 2y + 1 = 0 \text{ ---(1)}$$

$$2x - 3y - 12 = 0 \text{ ---(2)}$$

By cross multiplication, we have

$$\therefore \frac{x}{[2 \times (-12) - 1 \times (-3)]} = \frac{y}{[1 \times 2 - 1 \times (-12)]} = \frac{1}{[1 \times (-3) - 2 \times 2]}$$

$$\Rightarrow \frac{x}{[-24 + 3]} = \frac{y}{[2 + 12]} = \frac{1}{[-3 - 4]}$$

$$\Rightarrow \frac{x}{-21} = \frac{1}{-7}, \frac{y}{14} = \frac{1}{-7}$$

$$\Rightarrow x = \frac{-21}{-7} = 3, y = \frac{14}{-7} = -2$$

Hence,  $x = 3$  and  $y = -2$  is the solution

Question 2:

$$2x + 5y - 1 = 0 \text{ ---(1)}$$

$$2x + 3y - 3 = 0 \text{ ---(2)}$$

By cross multiplication we have

$$\therefore \frac{x}{5 \times (-3) - 3 \times (-1)} = \frac{y}{(-1) \times 2 - (-3) \times 2} = \frac{1}{2 \times 3 - 2 \times 5}$$

$$\Rightarrow \frac{x}{-15 + 3} = \frac{y}{-2 + 6} = \frac{1}{6 - 10}$$

$$\Rightarrow \frac{x}{-12} = \frac{y}{4} = \frac{1}{-4}$$

$$\Rightarrow \frac{x}{-12} = \frac{1}{-4} \Rightarrow x = \frac{-12}{-4} = 3$$

$$\Rightarrow \frac{y}{4} = \frac{1}{-4} \Rightarrow y = \frac{4}{-4} = -1$$

Hence the solution is  $x = 3, y = -1$

Question 3:

$$3x - 2y + 3 = 0$$

$$4x + 3y - 47 = 0$$

By cross multiplication we have

$$\therefore \frac{x}{[(-2) \times (-47) - (3 \times 3)]} = \frac{y}{[(3 \times 4) - (-47) \times 3]} = \frac{1}{[3 \times 3 - (-2) \times 4]}$$

$$\Rightarrow \frac{x}{(94 - 9)} = \frac{y}{(12 + 141)} = \frac{1}{(9 + 8)}$$

$$\Rightarrow \frac{x}{85} = \frac{y}{153} = \frac{1}{17}$$

$$\Rightarrow \frac{x}{85} = \frac{1}{17}, \frac{y}{153} = \frac{1}{17}$$

$$17x = 85, 17y = 153$$

$$\Rightarrow x = \frac{85}{17}, y = \frac{153}{17}$$

Hence the solution is  $x = 5, y = 9$
