Exercise 9.5 : Solutions of Questions on Page Number : **406**

Q1 : $\left(x^2+xy\right)dy=\left(x^2+y^2\right)dx$

Answer :

The given differential equation i.e., $(x^2 + xy)\ dy = (x^2 + y^2)\ dx$ can be written as:

$$\frac{dy}{dx}=\frac{x^2+y^2}{x^2+xy} \qquad ...(1)$$

$$\text{Let } F(x,y)=\frac{x^2+y^2}{x^2+xy}.$$

$$\text{Now, } F(\lambda x,\lambda y)=\frac{(\lambda x)^2+(\lambda y)^2}{(\lambda x)^2+(\lambda x)(\lambda y)}=\frac{x^2+y^2}{x^2+xy}=\lambda^0\cdot F(x,y)$$

This shows that equation (1) is a homogeneous equation.

To solve it, we make the substitution as:

$y = vx$

Differentiating both sides with respect to x, we get:

$$\frac{dy}{dx}=v+x\frac{dv}{dx}$$

Substituting the values of v and $\frac{dy}{dx}$ in equation (1), we get:

$$v+x\frac{dv}{dx}=\frac{x^2+(vx)^2}{x^2+x(vx)}$$
$$\Rightarrow v+x\frac{dv}{dx}=\frac{1+v^2}{1+v}$$
$$\Rightarrow x\frac{dv}{dx}=\frac{1+v^2}{1+v}-v=\frac{\left(1+v^2\right)-v(1+v)}{1+v}$$
$$\Rightarrow x\frac{dv}{dx}=\frac{1-v}{1+v}$$
$$\Rightarrow \left(\frac{1+v}{1-v}\right)=dv=\frac{dx}{x}$$
$$\Rightarrow \left(\frac{2-1+v}{1-v}\right)dv=\frac{dx}{x}$$
$$\Rightarrow \left(\frac{2}{1-v}-1\right)dv=\frac{dx}{x}$$

Integrating both sides, we get:

$$-2\log(1-v)-v=\log x-\log k$$
$$\Rightarrow v=-2\log(1-v)-\log x+\log k$$
$$\Rightarrow v=\log\left[\frac{k}{x(1-v)^2}\right]$$
$$\Rightarrow \frac{y}{x}=\log\left[\frac{k}{x\left(1-\frac{y}{x}\right)^2}\right]$$
$$\Rightarrow \frac{y}{x}=\log\left[\frac{kx}{(x-y)^2}\right]$$
$$\Rightarrow \frac{kx}{(x-y)^2}=e^{\frac{y}{x}}$$
$$\Rightarrow (x-y)^2=kxe^{-\frac{y}{x}}$$

This is the required solution of the given differential equation.

Q2 : $y'=\frac{x+y}{x}$

Answer :

The given differential equation is:

$$y'=\frac{x+y}{x}$$
$$\Rightarrow \frac{dy}{dx}=\frac{x+y}{x} \qquad ...(1)$$

Let $F(x,y)=\frac{x+y}{x}$.

Now, $F(\lambda x,\lambda y)=\frac{\lambda x+\lambda y}{\lambda x}=\frac{x+y}{x}=\lambda^0 F(x,y)$

Thus, the given equation is a homogeneous equation.

To solve it, we make the substitution as:

$y = vx$

Differentiating both sides with respect to x, we get:

$$\frac{dy}{dx}=v+x\frac{dv}{dx}$$

Substituting the values of y and $\frac{dy}{dx}$ in equation (1), we get:

$$v+x\frac{dv}{dx}=\frac{x+vx}{x}$$
$$\Rightarrow v+x\frac{dv}{dx}=1+v$$
$$x\frac{dv}{dx}=1$$
$$\Rightarrow dv=\frac{dx}{x}$$

Integrating both sides, we get:

$$v=\log x+C$$
$$\Rightarrow \frac{y}{x}=\log x+C$$
$$\Rightarrow y=x\log x+Cx$$

This is the required solution of the given differential equation.

Q3 : $(x-y)dy-(x+y)dx=0$

Answer :

The given differential equation is:

$$(x-y)dy-(x+y)dx=0$$

$$\Rightarrow \frac{dy}{dx}=\frac{x+y}{x-y} \qquad ...(1)$$

Let $F(x,y)=\frac{x+y}{x-y}$.

$$\therefore F(\lambda x,\lambda y)=\frac{\lambda x+\lambda y}{\lambda x-\lambda y}=\frac{x+y}{x-y}=\lambda^0\cdot F(x,y)$$

Thus, the given differential equation is a homogeneous equation.

To solve it, we make the substitution as:

$y = vx$

$$\Rightarrow \frac{d}{dx}(y)=\frac{d}{dx}(vx)$$
$$\Rightarrow \frac{dy}{dx}=v+x\frac{dv}{dx}$$

Substituting the values of y and $\frac{dy}{dx}$ in equation (1), we get:

$$v+x\frac{dv}{dx}=\frac{x+vx}{x-vx}=\frac{1+v}{1-v}$$
$$x\frac{dv}{dx}=\frac{1+v}{1-v}-v=\frac{1+v-v(1-v)}{1-v}$$
$$\Rightarrow x\frac{dv}{dx}=\frac{1+v^2}{1-v}$$
$$\Rightarrow \frac{1-v}{(1+v^2)}dv=\frac{dx}{x}$$
$$\Rightarrow \left(\frac{1}{1+v^2}-\frac{v}{1-v^2}\right)dv=\frac{dx}{x}$$

Integrating both sides, we get:

$$\tan^{-1}v-\frac{1}{2}\log(1+v^2)=\log x+C$$
$$\Rightarrow \tan^{-1}\left(\frac{y}{x}\right)-\frac{1}{2}\log\left[1+\left(\frac{y}{x}\right)^2\right]=\log x+C$$
$$\Rightarrow \tan^{-1}\left(\frac{y}{x}\right)-\frac{1}{2}\log\left(\frac{x^2+y^2}{x^2}\right)=\log x+C$$
$$\Rightarrow \tan^{-1}\left(\frac{y}{x}\right)-\frac{1}{2}\left[\log(x^2+y^2)-\log x^2\right]=\log x+C$$
$$\Rightarrow \tan^{-1}\left(\frac{y}{x}\right)=\frac{1}{2}\log(x^2+y^2)+C$$

This is the required solution of the given differential equation.

Answer needs Correction? Click Here

Q4 : $(x^2-y^2)dx+2xy\,dy=0$

Answer :

Answer :

The given differential equation is:

$$(x^2-y^2)dx+2xy\ dy=0$$

$$\Rightarrow \frac{dy}{dx}=\frac{-(x^2-y^2)}{2xy} \qquad ...(1)$$

Let $F(x,y)=\frac{-(x^2-y^2)}{2xy}$.

$$\therefore\ F(\lambda x,\lambda y)=\left[\frac{(\lambda x)^2-(\lambda y)^2}{2(\lambda x)(\lambda y)}\right]=\frac{-(x^2-y^2)}{2xy}=\lambda^0\cdot F(x,y)$$

Therefore, the given differential equation is a homogeneous equation.

To solve it, we make the substitution as:

$y = vx$

$$\Rightarrow \frac{d}{dx}(y)=\frac{d}{dx}(vx)$$

$$\Rightarrow \frac{dy}{dx}=v+x\frac{dv}{dx}$$

Substituting the values of y and $\frac{dy}{dx}$ in equation (1), we get:

$$v+x\frac{dv}{dx}=-\left[\frac{x^2-(vx)^2}{2x\cdot(vx)}\right]$$

$$v+x\frac{dv}{dx}=\frac{v^2-1}{2v}$$

$$\Rightarrow x\frac{dv}{dx}=\frac{v^2-1}{2v}-v=\frac{v^2-1-2v^2}{2v}$$

$$\Rightarrow x\frac{dv}{dx}=-\frac{(1+v^2)}{2v}$$

$$\Rightarrow \frac{2v}{1+v^2}dv=-\frac{dx}{x}$$

Integrating both sides, we get:

$$\log(1+v^2)=-\log x+\log C=\log\frac{C}{x}$$

$$\Rightarrow 1+v^2=\frac{C}{x}$$

$$\Rightarrow \left[1+\frac{y^2}{x^2}\right]=\frac{C}{x}$$

$$\Rightarrow x^2+y^2=Cx$$

This is the required solution of the given differential equation.

Answer needs Correction? **Click Here**

Q5 : $x^2\frac{dy}{dx}=x^2-2y^2+xy$

Answer :

The given differential equation is:

$$x^2\frac{dy}{dx}=x^2-2y^2+xy$$

$$\frac{dy}{dx}=\frac{x^2-2y^2+xy}{x^2} \qquad ...(1)$$

Let $F(x,y)=\frac{x^2-2y^2+xy}{x^2}$.

$$\therefore\ F(\lambda x,\lambda y)=\frac{(\lambda x)^2-2(\lambda y)^2+(\lambda x)(\lambda y)}{(\lambda x)^2}=\frac{x^2-2y^2+xy}{x^2}=\lambda^0\cdot F(x,y)$$

Therefore, the given differential equation is a homogeneous equation.

To solve it, we make the substitution as:

$y = vx$

$$\Rightarrow \frac{dy}{dx}=v+x\frac{dv}{dx}$$

Substituting the values of y and $\frac{dy}{dx}$ in equation (1), we get:

$$v+x\frac{dv}{dx}=\frac{x^2-2(vx)^2+x\cdot(vx)}{x^2}$$

$$\Rightarrow v+x\frac{dv}{dx}=1-2v^2+v$$

$$\Rightarrow x\frac{dv}{dx}=1-2v^2$$

$$\Rightarrow \frac{dv}{1-2v^2}=\frac{dx}{x}$$

$$\Rightarrow \frac{1}{2}\cdot\frac{dv}{\frac{1}{2}-v^2}=\frac{dx}{x}$$

$$\Rightarrow \frac{1}{2}\cdot\left[\frac{dv}{\left(\frac{1}{\sqrt{2}}\right)^2-v^2}\right]=\frac{dx}{x}$$

Integrating both sides, we get:

$$\frac{1}{2}\cdot\frac{1}{2\times\frac{1}{\sqrt{2}}}\log\left|\frac{\frac{1}{\sqrt{2}}+v}{\frac{1}{\sqrt{2}}-v}\right|=\log|x|+C$$

$$\Rightarrow\frac{1}{2\sqrt{2}}\log\left|\frac{\frac{1}{\sqrt{2}}+\frac{y}{x}}{\frac{1}{\sqrt{2}}-\frac{y}{x}}\right|=\log|x|+C$$

$$\Rightarrow\frac{1}{2\sqrt{2}}\log\left|\frac{x+\sqrt{2}y}{x-\sqrt{2}y}\right|=\log|x|+C$$

This is the required solution for the given differential equation.

Answer needs Correction? **Click Here**

Q6 : $xdy-ydx=\sqrt{x^2+y^2}\,dx$

Answer :

$$xdy-ydx=\sqrt{x^2+y^2}\,dx$$

$$\Rightarrow xdy=\left[y+\sqrt{x^2+y^2}\right]dx$$

$$\frac{dy}{dx}=\frac{y+\sqrt{x^2+y^2}}{x}\qquad\ldots(1)$$

$$\text{Let } F(x,y)=\frac{y+\sqrt{x^2+y^2}}{x}.$$

$$\therefore F(\lambda x,\lambda y)=\frac{\lambda x+\sqrt{(\lambda x)^2+(\lambda y)^2}}{\lambda x}=\frac{y+\sqrt{x^2+y^2}}{x}=\lambda^0\cdot F(x,y)$$

Therefore, the given differential equation is a homogeneous equation.

To solve it, we make the substitution as:

y = *vx*

$$\Rightarrow\frac{d}{dx}(y)=\frac{d}{dx}(vx)$$

$$\Rightarrow\frac{dy}{dx}=v+x\frac{dv}{dx}$$

Substituting the values of *v* and $\frac{dy}{dx}$ in equation (1), we get:

$$v+x\frac{dv}{dx}=\frac{vx+\sqrt{x^2+(vx)^2}}{x}$$

$$\Rightarrow v+x\frac{dv}{dx}=v+\sqrt{1+v^2}$$

$$\Rightarrow\frac{dv}{\sqrt{1+v^2}}=\frac{dx}{x}$$

Integrating both sides, we get:

$$\log\left|v+\sqrt{1+v^2}\right|=\log|x|+\log C$$

$$\Rightarrow\log\left|\frac{y}{x}+\sqrt{1+\frac{y^2}{x^2}}\right|=\log|Cx|$$

$$\Rightarrow\log\left|\frac{y+\sqrt{x^2+y^2}}{x}\right|=\log|Cx|$$

$$\Rightarrow y+\sqrt{x^2+y^2}=Cx^2$$

This is the required solution of the given differential equation.

Answer needs Correction? **Click Here**

Q7 : $\left\{x\cos\left(\frac{y}{x}\right)+y\sin\left(\frac{y}{x}\right)\right\}ydx=\left\{y\sin\left(\frac{y}{x}\right)-x\cos\left(\frac{y}{x}\right)\right\}xdy$

Answer :

The given differential equation is:

$$\left\{x\cos\left(\frac{y}{x}\right)+y\sin\left(\frac{y}{x}\right)\right\}ydx=\left\{y\sin\left(\frac{y}{x}\right)-x\cos\left(\frac{y}{x}\right)\right\}xdy$$

$$\frac{dy}{dx}=\frac{\left\{x\cos\left(\frac{y}{x}\right)+y\sin\left(\frac{y}{x}\right)\right\}y}{\left\{y\sin\left(\frac{y}{x}\right)-x\cos\left(\frac{y}{x}\right)\right\}x}\qquad\ldots(1)$$

$$\text{Let } F(x,y)=\frac{\left\{x\cos\left(\frac{y}{x}\right)+y\sin\left(\frac{y}{x}\right)\right\}y}{\left\{y\sin\left(\frac{y}{x}\right)-x\cos\left(\frac{y}{x}\right)\right\}x}.$$

$$\therefore F(\lambda x,\lambda y)=\frac{\left\{\lambda x\cos\left(\frac{\lambda y}{\lambda x}\right)+\lambda y\sin\left(\frac{\lambda y}{\lambda x}\right)\right\}\lambda y}{\left\{\lambda y\sin\left(\frac{\lambda y}{\lambda x}\right)-\lambda x\sin\left(\frac{\lambda y}{\lambda x}\right)\right\}\lambda x}$$

$$=\frac{\left\{x\cos\left(\frac{y}{x}\right)+y\sin\left(\frac{y}{x}\right)\right\}y}{\left\{y\sin\left(\frac{y}{x}\right)-x\cos\left(\frac{y}{x}\right)\right\}x}$$

$$= \lambda^{\circ} \cdot F(x,y)$$

Therefore, the given differential equation is a homogeneous equation.

To solve it, we make the substitution as:

$y = vx$

$$\Rightarrow \frac{dy}{dx} = v + x = \frac{dv}{dx}$$

Substituting the values of y and $\frac{dy}{dx}$ in equation (1), we get:

$$v + x\frac{dv}{dx} = \frac{(x\cos v + vx\sin v)\cdot vx}{(vx\sin v - x\cos v)\cdot x}$$
$$\Rightarrow v + x\frac{dv}{dx} = \frac{v\cos v + v^2\sin v}{v\sin v - \cos v}$$
$$\Rightarrow x\frac{dv}{dx} = \frac{v\cos v + v^2\sin v}{v\sin v - \cos v} - v$$
$$\Rightarrow x\frac{dv}{dx} = \frac{v\cos v + v^2\sin v - v^2\sin v + v\cos v}{v\sin v - \cos v}$$
$$\Rightarrow x\frac{dv}{dx} = \frac{2v\cos v}{v\sin v - \cos v}$$
$$\Rightarrow \left[\frac{v\sin v - \cos v}{v\cos v}\right]dv = \frac{2dx}{x}$$
$$\Rightarrow \left(\tan v - \frac{1}{v}\right)dv = \frac{2dx}{x}$$

Integrating both sides, we get:

$$\log(\sec v) - \log v = 2\log x + \log C$$
$$\Rightarrow \log\left(\frac{\sec v}{v}\right) = \log\left(Cx^2\right)$$
$$\Rightarrow \left(\frac{\sec v}{v}\right) = Cx^2$$
$$\Rightarrow \sec v = Cx^2 v$$
$$\Rightarrow \sec\left(\frac{y}{x}\right) = C\cdot x^2\cdot\frac{y}{x}$$
$$\Rightarrow \sec\left(\frac{y}{x}\right) = Cxy$$
$$\Rightarrow \cos\left(\frac{y}{x}\right) = \frac{1}{Cxy} = \frac{1}{C}\cdot\frac{1}{xy}$$
$$\Rightarrow xy\cos\left(\frac{y}{x}\right) = k \qquad \left(k = \frac{1}{C}\right)$$

This is the required solution of the given differential equation.

Answer needs Correction? **Click Here**

Q8 : $x\frac{dy}{dx} - y + x\sin\left(\frac{y}{x}\right) = 0$

Answer :

$$x\frac{dy}{dx} - y + x\sin\left(\frac{y}{x}\right) = 0$$
$$\Rightarrow x\frac{dy}{dx} = y - x\sin\left(\frac{y}{x}\right)$$
$$\Rightarrow \frac{dy}{dx} = \frac{y - x\sin\left(\frac{y}{x}\right)}{x} \qquad \ldots(1)$$

$$\text{Let } F(x,y) = \frac{y - x\sin\left(\frac{y}{x}\right)}{x}.$$

$$\therefore\ F(\lambda x, \lambda y) = \frac{\lambda y - \lambda x\sin\left(\frac{\lambda y}{\lambda x}\right)}{\lambda x} = \frac{y - x\sin\left(\frac{y}{x}\right)}{x} = \lambda^0\cdot F(x,y)$$

Therefore, the given differential equation is a homogeneous equation.

To solve it, we make the substitution as:

$y = vx$

$$\Rightarrow \frac{d}{dx}(y) = \frac{d}{dx}(vx)$$
$$\Rightarrow \frac{dy}{dx} = v + x\frac{dv}{dx}$$

Substituting the values of y and $\frac{dy}{dx}$ in equation (1), we get:

$$v + x\frac{dv}{dx} = \frac{vx - x\sin v}{x}$$
$$\Rightarrow v + x\frac{dv}{dx} = v - \sin v$$
$$\Rightarrow -\frac{dv}{\sin v} = \frac{dx}{x}$$
$$\Rightarrow \operatorname{cosec} v\, dv = -\frac{dx}{x}$$

Integrating both sides, we get:

$$\log\left|\operatorname{cosec} v - \cot v\right| = -\log x + \log C = \log\frac{C}{x}$$
$$\Rightarrow \operatorname{cosec}\left(\frac{y}{x}\right) - \cot\left(\frac{y}{x}\right) = \frac{C}{x}$$

$$\Rightarrow \frac{1}{\sin\left(\frac{y}{x}\right)} - \frac{\cos\left(\frac{y}{x}\right)}{\sin\left(\frac{y}{x}\right)} = \frac{C}{x}$$
$$\Rightarrow x\left[1-\cos\left(\frac{y}{x}\right)\right] = C\sin\left(\frac{y}{x}\right)$$

This is the required solution of the given differential equation.

Answer needs Correction? **Click Here**

Q9 : $ydx + x\log\left(\frac{y}{x}\right)dy - 2xdy = 0$

Answer :

$$ydx + x\log\left(\frac{y}{x}\right)dy - 2xdy = 0$$
$$\Rightarrow ydx = \left[2x - x\log\left(\frac{y}{x}\right)\right]dy$$
$$\Rightarrow \frac{dy}{dx} = \frac{y}{2x - x\log\left(\frac{y}{x}\right)} \qquad ...(1)$$

$$\text{Let } F(x,y) = \frac{y}{2x - x\log\left(\frac{y}{x}\right)}.$$
$$\therefore\ F(\lambda x, \lambda y) = \frac{\lambda y}{2(\lambda x) - (\lambda x)\log\left(\frac{\lambda y}{\lambda x}\right)} = \frac{y}{2x - \log\left(\frac{y}{x}\right)} = \lambda^0 \cdot F(x,y)$$

Therefore, the given differential equation is a homogeneous equation.

To solve it, we make the substitution as:

$y = vx$

$$\Rightarrow \frac{dy}{dx} = \frac{d}{dx}(vx)$$
$$\Rightarrow \frac{dy}{dx} = v + x\frac{dv}{dx}$$

Substituting the values of y and $\frac{dy}{dx}$ in equation (1), we get:

$$v + x\frac{dv}{dx} = \frac{vx}{2x - x\log v}$$
$$\Rightarrow v + x\frac{dv}{dx} = \frac{v}{2-\log v}$$
$$\Rightarrow x\frac{dv}{dx} = \frac{v}{2-\log v} - v$$
$$\Rightarrow x\frac{dv}{dx} = \frac{v - 2v + v\log v}{2-\log v}$$
$$\Rightarrow x\frac{dv}{dx} = \frac{v\log v - v}{2-\log v}$$
$$\Rightarrow \frac{2-\log v}{v(\log v - 1)}dv = \frac{dx}{x}$$
$$\Rightarrow \left[\frac{1+(1-\log v)}{v(\log v-1)}\right]dv = \frac{dx}{x}$$
$$\Rightarrow \left[\frac{1}{v(\log v-1)} - \frac{1}{v}\right]dv = \frac{dx}{x}$$

Integrating both sides, we get:

$$\int \frac{1}{v(\log v - 1)}dv - \int \frac{1}{v}dv = \int \frac{1}{x}dx$$
$$\Rightarrow \int \frac{dv}{v(\log v-1)} - \log v = \log x + \log C \qquad ...(2)$$

$$\Rightarrow \text{Let } \log v - 1 = t$$
$$\Rightarrow \frac{d}{dv}(\log v - 1) = \frac{dt}{dv}$$
$$\Rightarrow \frac{1}{v} = \frac{dt}{dv}$$
$$\Rightarrow \frac{dv}{v} = dt$$

Therefore, equation (1) becomes:

$$\Rightarrow \int \frac{dt}{t} - \log v = \log x + \log C$$
$$\Rightarrow \log t - \log\left(\frac{y}{x}\right) = \log(Cx)$$
$$\Rightarrow \log\left[\log\left(\frac{y}{x}\right) - 1\right] - \log\left(\frac{y}{x}\right) = \log(Cx)$$
$$\Rightarrow \log\left[\frac{\log\left(\frac{y}{x}\right)-1}{\frac{y}{x}}\right] = \log(Cx)$$
$$\Rightarrow \frac{x}{y}\left[\log\left(\frac{y}{x}\right) - 1\right] = Cx$$
$$\Rightarrow \log\left(\frac{y}{x}\right) - 1 = Cy$$

This is the required solution of the given differential equation.

Q10 : $\left(1+e^{\frac{x}{y}}\right)dx+e^{\frac{x}{y}}\left(1-\frac{x}{y}\right)dy=0$

Answer :

$$\left(1+e^{\frac{x}{y}}\right)dx+e^{\frac{x}{y}}\left(1-\frac{x}{y}\right)dy=0$$
$$\Rightarrow\left(1+e^{\frac{x}{y}}\right)dx=-e^{\frac{x}{y}}\left(1-\frac{x}{y}\right)dy$$
$$\Rightarrow\frac{dx}{dy}=\frac{-e^{\frac{x}{y}}\left(1-\frac{x}{y}\right)}{1+e^{\frac{x}{y}}}\qquad\ldots(1)$$
$$\text{Let } F(x,y)=\frac{-e^{\frac{x}{y}}\left(1-\frac{x}{y}\right)}{1+e^{\frac{x}{y}}}.$$
$$\therefore\ F(\lambda x,\lambda y)=\frac{-e^{\frac{\lambda x}{\lambda y}}\left(1-\frac{\lambda x}{\lambda y}\right)}{1+e^{\frac{\lambda x}{\lambda y}}}=\frac{-e^{\frac{x}{y}}\left(1-\frac{x}{y}\right)}{1+e^{\frac{x}{y}}}=\lambda^0\cdot F(x,y)$$

Therefore, the given differential equation is a homogeneous equation.

To solve it, we make the substitution as:

$x = vy$

$$\Rightarrow\frac{d}{dy}(x)=\frac{d}{dy}(vy)$$
$$\Rightarrow\frac{dx}{dy}=v+y\frac{dv}{dy}$$

Substituting the values of x and $\frac{dx}{dy}$ in equation (1), we get:

$$v+y\frac{dv}{dy}=\frac{-e^v(1-v)}{1+e^v}$$
$$\Rightarrow y\frac{dv}{dy}=\frac{-e^v+ve^v}{1+e^v}-v$$
$$\Rightarrow y\frac{dv}{dy}=\frac{-e^v+ve^v-v-ve^v}{1+e^v}$$
$$\Rightarrow y\frac{dv}{dy}=-\left[\frac{v+e^v}{1+e^v}\right]$$
$$\Rightarrow\left[\frac{1+e^v}{v+e^v}\right]dv=-\frac{dy}{y}$$

Integrating both sides, we get:

$$\Rightarrow\log\left(v+e^v\right)=-\log y+\log C=\log\left(\frac{C}{y}\right)$$
$$\Rightarrow\left[\frac{x}{y}+e^{\frac{x}{y}}\right]=\frac{C}{y}$$
$$\Rightarrow x+ye^{\frac{x}{y}}=C$$

This is the required solution of the given differential equation.

Answer needs Correction? Click Here

Q11 : $(x+y)dy+(x-y)dx=0;\ y=1$ when $x=1$

Answer :

$$(x+y)dy+(x-y)dx=0$$
$$\Rightarrow(x+y)dy=-(x-y)dx$$
$$\Rightarrow\frac{dy}{dx}=\frac{-(x-y)}{x+y}\qquad\ldots(1)$$
$$\text{Let } F(x,y)=\frac{-(x-y)}{x+y}.$$
$$\therefore\ F(\lambda x,\lambda y)=\frac{-(\lambda x-\lambda y)}{\lambda x-\lambda y}=\frac{-(x-y)}{x+y}=\lambda^0\cdot F(x,y)$$

Therefore, the given differential equation is a homogeneous equation.

To solve it, we make the substitution as:

$y = vx$

$$\Rightarrow\frac{d}{dx}(y)=\frac{d}{dx}(vx)$$
$$\Rightarrow\frac{dy}{dx}=v+x\frac{dv}{dx}$$

Substituting the values of y and $\frac{dy}{dx}$ in equation (1), we get:

$$v+x\frac{dv}{dx}=\frac{-(x-vx)}{}$$

$dx \quad x+vx$

$$\Rightarrow v+x\frac{dv}{dx}=\frac{v-1}{v+1}$$
$$\Rightarrow x\frac{dv}{dx}=\frac{v-1}{v+1}-v=\frac{v-1-v(v+1)}{v+1}$$
$$\Rightarrow x\frac{dv}{dx}=\frac{v-1-v^2-v}{v+1}=\frac{-(1+v^2)}{v+1}$$
$$\Rightarrow \frac{(v+1)}{1+v^2}dv=-\frac{dx}{x}$$
$$\Rightarrow \left[\frac{v}{1+v^2}+\frac{1}{1+v^2}\right]dv=-\frac{dx}{x}$$

Integrating both sides, we get:

$$\frac{1}{2}\log(1+v^2)+\tan^{-1}v=-\log x+k$$
$$\Rightarrow \log(1+v^2)+2\tan^{-1}v=-2\log x+2k$$
$$\Rightarrow \log\left[(1+v^2)\cdot x^2\right]+2\tan^{-1}v=2k$$
$$\Rightarrow \log\left[\left(1+\frac{y^2}{x^2}\right)\cdot x^2\right]+2\tan^{-1}\frac{y}{x}=2k$$
$$\Rightarrow \log(x^2+y^2)+2\tan^{-1}\frac{y}{x}=2k \qquad \ldots(2)$$

Now, $y = 1$ at $x = 1$.

$$\Rightarrow \log 2+2\tan^{-1}1=2k$$
$$\Rightarrow \log 2+2\times\frac{\pi}{4}=2k$$
$$\Rightarrow \frac{\pi}{2}+\log 2=2k$$

Substituting the value of $2k$ in equation (2), we get:

$$\log(x^2+y^2)+2\tan^{-1}\left(\frac{y}{x}\right)=\frac{\pi}{2}+\log 2$$

This is the required solution of the given differential equation.

Answer needs Correction? **Click Here**

Q12 : $x^2dy+(xy+y^2)dx=0;\ y=1 \text{ when } x=1$

Answer :

$$x^2dy+(xy+y^2)dx=0$$
$$\Rightarrow x^2dy=-(xy+y^2)dx$$
$$\Rightarrow \frac{dy}{dx}=\frac{-(xy+y^2)}{x^2} \qquad \ldots(1)$$

Let $F(x,y)=\frac{-(xy+y^2)}{x^2}$.

$$\therefore\ F(\lambda x,\lambda y)=\frac{\left[\lambda x\cdot\lambda y+(\lambda y)^2\right]}{(\lambda x)^2}=\frac{-(xy+y^2)}{x^2}=\lambda^0\cdot F(x,y)$$

Therefore, the given differential equation is a homogeneous equation.

To solve it, we make the substitution as:

$y = vx$

$$\Rightarrow \frac{d}{dx}(y)=\frac{d}{dx}(vx)$$
$$\Rightarrow \frac{dy}{dx}=v+x\frac{dv}{dx}$$

Substituting the values of y and $\frac{dy}{dx}$ in equation (1), we get:

$$v+x\frac{dv}{dx}=\frac{-\left[x\cdot vx+(vx)^2\right]}{x^2}=-v-v^2$$
$$\Rightarrow x\frac{dv}{dx}=-v^2-2v=-v(v+2)$$
$$\Rightarrow \frac{dv}{v(v+2)}=-\frac{dx}{x}$$
$$\Rightarrow \frac{1}{2}\left[\frac{(v+2)-v}{v(v+2)}\right]dv=-\frac{dx}{x}$$
$$\Rightarrow \frac{1}{2}\left[\frac{1}{v}-\frac{1}{v+2}\right]dv=-\frac{dx}{x}$$

Integrating both sides, we get:

$$\frac{1}{2}\left[\log v-\log(v+2)\right]=-\log x+\log C$$
$$\Rightarrow \frac{1}{2}\log\left(\frac{v}{v+2}\right)=\log\frac{C}{x}$$
$$\Rightarrow \frac{v}{v+2}=\left(\frac{C}{x}\right)^2$$
$$\Rightarrow \frac{\frac{y}{x}}{\frac{y}{x}+2}=\left(\frac{C}{x}\right)^2$$
$$\Rightarrow \frac{y}{y+2x}=\frac{C^2}{x^2}$$

$x^2y \quad C^2 \quad (3)$

$$\Rightarrow \frac{x^2y}{y+2x} = C^2 \quad ...(2)$$

Now, $y = 1$ at $x = 1$.

$$\Rightarrow \frac{1}{1+2} = C^2$$
$$\Rightarrow C^2 = \frac{1}{3}$$

Substituting $C^2 = \frac{1}{3}$ in equation (2), we get:

$$\frac{x^2y}{y+2x} = \frac{1}{3}$$
$$\Rightarrow y + 2x = 3x^2y$$

This is the required solution of the given differential equation.

Q13 : $\left[x\sin^2\left(\frac{y}{x} - y\right)\right]dx + xdy = 0; y = \frac{\pi}{4}$ when $x = 1$

Answer :

$$\left[x\sin^2\left(\frac{y}{x}\right) - y\right]dx + xdy = 0$$
$$\Rightarrow \frac{dy}{dx} = \frac{-\left[x\sin^2\left(\frac{y}{x}\right) - y\right]}{x} \quad ...(1)$$
$$\text{Let } F(x,y) = \frac{-\left[x\sin^2\left(\frac{y}{x}\right) - y\right]}{x}.$$
$$\therefore F(\lambda x, \lambda y) = \frac{-\left[\lambda x \cdot \sin^2\left(\frac{\lambda x}{\lambda y}\right) - \lambda y\right]}{\lambda x} = \frac{-\left[x\sin^2\left(\frac{y}{x}\right) - y\right]}{x} = \lambda^0 \cdot F(x,y)$$

Therefore, the given differential equation is a homogeneous equation.

To solve this differential equation, we make the substitution as:

$y = vx$

$$\Rightarrow \frac{d}{dx}(y) = \frac{d}{dx}(vx)$$
$$\Rightarrow \frac{dy}{dx} = v + x = \frac{dv}{dx}$$

Substituting the values of y and $\frac{dy}{dx}$ in equation (1), we get:

$$v + x\frac{dv}{dx} = \frac{-\left[x\sin^2 v - vx\right]}{x}$$
$$\Rightarrow v + x\frac{dv}{dx} = -\left[\sin^2 v - v\right] = v - \sin^2 v$$
$$\Rightarrow x\frac{dv}{dx} = -\sin^2 v$$
$$\Rightarrow \frac{dv}{\sin^2 v} = -\frac{dx}{dx}$$
$$\Rightarrow \operatorname{cosec}^2 v dv = -\frac{dx}{x}$$

Integrating both sides, we get:

$$-\cot v = -\log|x| - C$$
$$\Rightarrow \cot v = \log|x| + C$$
$$\Rightarrow \cot\left(\frac{y}{x}\right) = \log|x| + \log C$$
$$\Rightarrow \cot\left(\frac{y}{x}\right) = \log|Cx| \quad ...(2)$$

Now, $y = \frac{\pi}{4}$ at $x = 1$.

$$\Rightarrow \cot\left(\frac{\pi}{4}\right) = \log|C|$$
$$\Rightarrow 1 = \log C$$
$$\Rightarrow C = e^1 = e$$

Substituting C = e in equation (2), we get:

$$\cot\left(\frac{y}{x}\right) = \log|ex|$$

This is the required solution of the given differential equation.

Q14 : $\frac{dy}{dx} - \frac{y}{x} + \operatorname{cosec}\left(\frac{y}{x}\right) = 0; y = 0$ when $x = 1$

Answer :

$$\frac{dy}{dx} - \frac{y}{x} + \operatorname{cosec}\left(\frac{y}{x}\right) = 0$$
$$\Rightarrow \frac{dy}{dx} = \frac{y}{x} - \operatorname{cosec}\left(\frac{y}{x}\right) \quad ...(1)$$

Let $F(x,y)=\frac{y}{x}-\operatorname{cosec}\left(\frac{y}{x}\right)$.

$$\therefore\ F(\lambda x,\lambda y)=\frac{\lambda y}{\lambda x}-\operatorname{cosec}\left(\frac{\lambda y}{\lambda x}\right)$$

$$\Rightarrow\ F(\lambda x,\lambda y)=\frac{y}{x}-\operatorname{cosec}\left(\frac{y}{x}\right)=F(x,y)=\lambda^0\cdot F(x,y)$$

Therefore, the given differential equation is a homogeneous equation.

To solve it, we make the substitution as:

$y = vx$

$$\Rightarrow \frac{d}{dx}(y)=\frac{d}{dx}(vx)$$

$$\Rightarrow \frac{dy}{dx}=v+x\frac{dv}{dx}$$

Substituting the values of y and $\frac{dy}{dx}$ in equation (1), we get:

$$v+x\frac{dv}{dx}=v-\operatorname{cosec} v$$

$$\Rightarrow -\frac{dv}{\operatorname{cosec} v}=-\frac{dx}{x}$$

$$\Rightarrow -\sin v dv=\frac{dx}{x}$$

Integrating both sides, we get:

$$\cos v=\log x+\log C=\log|Cx|$$

$$\Rightarrow \cos\left(\frac{y}{x}\right)=\log|Cx| \qquad ...(2)$$

This is the required solution of the given differential equation.

Now, $y = 0$ at $x = 1$.

$$\Rightarrow \cos(0)=\log C$$

$$\Rightarrow 1=\log C$$

$$\Rightarrow C=e^1=e$$

Substituting C = e in equation (2), we get:

$$\cos\left(\frac{y}{x}\right)=\log|(ex)|$$

This is the required solution of the given differential equation.

Q15 : $2xy+y^2-2x^2\frac{dy}{dx}=0;\ y=2$ when $x=1$

Answer :

$$2xy+y^2-2x^2\frac{dy}{dx}=0$$

$$\Rightarrow 2x^2\frac{dy}{dx}=2xy+y^2$$

$$\Rightarrow \frac{dy}{dx}=\frac{2xy+y^2}{2x^2} \qquad ...(1)$$

Let $F(x,y)=\frac{2xy+y^2}{2x^2}$.

$$\therefore\ F(\lambda x,\lambda y)=\frac{2(\lambda x)(\lambda y)+(\lambda y)^2}{2(\lambda x)^2}=\frac{2xy+y^2}{2x^2}=\lambda^0\cdot F(x,y)$$

Therefore, the given differential equation is a homogeneous equation.

To solve it, we make the substitution as:

$y = vx$

$$\Rightarrow \frac{d}{dx}(y)=\frac{d}{dx}(vx)$$

$$\Rightarrow \frac{dy}{dx}=v+x\frac{dv}{dx}$$

Substituting the value of y and $\frac{dy}{dx}$ in equation (1), we get:

$$v+x\frac{dv}{dx}=\frac{2x(vx)+(vx)^2}{2x^2}$$

$$\Rightarrow v+x\frac{dv}{dx}=\frac{2v+v^2}{2}$$

$$\Rightarrow v+x\frac{dv}{dx}=v+\frac{v^2}{2}$$

$$\Rightarrow \frac{2}{v^2}dv=\frac{dx}{x}$$

Integrating both sides, we get:

$$2\cdot\frac{v^{-2+1}}{-2+1}=\log|x|+C$$

$$\Rightarrow -\frac{2}{v}=\log|x|+C$$

$$\Rightarrow -\frac{2}{\frac{y}{x}}=\log|x|+C$$

$$\Rightarrow -\frac{2x}{y}=\log|x|+C \qquad ...(2)$$

Now, $y = 2$ at $x = 1$.

$$\Rightarrow -1 = \log(1) + C$$
$$\Rightarrow C = -1$$

Substituting C = â€“1 in equation (2), we get:

$$-\frac{2x}{y} = \log|x| - 1$$
$$\Rightarrow \frac{2x}{y} = 1 - \log|x|$$
$$\Rightarrow y = \frac{2x}{1-\log|x|}, (x \neq 0, x \neq e)$$

This is the required solution of the given differential equation.

Q16 : A homogeneous differential equation of the form $\frac{dx}{dy} = h\left(\frac{x}{y}\right)$ can be solved by making the substitution

A. $y = vx$

B. $v = yx$

C. $x = vy$

D. $x = v$

Answer :

For solving the homogeneous equation of the form $\frac{dx}{dy} = h\left(\frac{x}{y}\right)$, we need to make the substitution as $x = vy$.

Hence, the correct answer is C.

Q17 : Which of the following is a homogeneous differential equation?

A. $(4x+6y+5)dy-(3y+2x+4)dx=0$

B. $(xy)dx-(x^3+y^3)dy=0$

C. $(x^3+2y^2)dx+2xy\,dy=0$

D. $y^2dx+(x^2-xy-y^2)dy=0$

Answer :

Function F(x, y) is said to be the homogenous function of degree n, if

F(ÃŽÂ»x, ÃŽÂ»y) = ÃŽÂ»^{n} F(x, y) for any non-zero constant (ÃŽÂ»).

Consider the equation given in alternativeD:

$$y^2dx+(x^2-xy-y^2)dy=0$$
$$\Rightarrow \frac{dy}{dx} = \frac{-y^2}{x^2-xy-y^2} = \frac{y^2}{y^2+xy-x^2}$$
$$\text{Let } F(x,y) = \frac{y^2}{y^2+xy-x^2}.$$
$$\Rightarrow F(\lambda x, \lambda y) = \frac{(\lambda y)^2}{(\lambda y)^2+(\lambda x)(\lambda y)-(\lambda x)^2}$$
$$= \frac{\lambda^2 y^2}{\lambda^2(y^2+xy-x^2)}$$
$$= \lambda^0\left(\frac{y^2}{y^2+xy-x^2}\right)$$
$$= \lambda^0 \cdot F(x,y)$$

Hence, the differential equation given in alternative **D** is a homogenous equation.
