

Quadrilaterals Ex 14.2 Q7

Answer:

The figure is given as follows:

It is given that ABCD is a parallelogram.

Thus,

$$\angle A + \angle B = 180^{\circ}$$

$$60^{\circ} + \angle B = 180^{\circ}$$

$$\angle B = 180^{\circ} - 60^{\circ}$$

$$\angle B = 120^{\circ}$$

Opposite angles of a parallelogram are equal.

Therefore,
$$\angle D = \angle B$$

 $\angle D = 120^{\circ}$

Also, we have AP as the bisector of $\angle A$ Therefore,

$$\angle DAP = \angle BAP$$
 (i)

Similarly,

$$\angle ABP = \angle PBA \dots$$
 (ii)

We have $DC \parallel AB$,

$$\angle DPA = \angle PAB$$

From (i)

$$\angle DPA = \angle DAP$$

Thus, sides opposite to equal angles are equal.

$$AD = DP$$

Similarly, $DC \parallel AB$

$$\angle CPB = \angle PBA$$

From (ii)

$$\angle CPB = \angle PBC$$

Thus, sides opposite to equal angles are equal.

$$PC = BC$$

Also,

$$DC = DP + PC$$

$$DC = AD + BC$$

$$DC = AD + AD$$

$$DC = 2AD$$
