

## Maxima and Minima 18.5 Q42

Let I be a line through the point P(1,4) that cuts the x-axis and y-axis.

Now, equation of I is

$$y-4=m(x-1)$$

$$x$$
 - Intercept is  $\frac{m-4}{m}$  and  $y$  - Intercept is  $4-m$ 

$$Let \qquad S = \frac{m-4}{m} + 4 - m$$

$$\therefore \qquad \frac{dS}{dm} = +\frac{4}{m^2} - 1$$

For maxima and minima,

$$\frac{dS}{dm} = 0$$

$$\Rightarrow \frac{4}{m^2} - 1 = 0$$

$$\Rightarrow$$
  $m = \pm 2$ 

Now,

$$\frac{d^2S}{dm^2} = -\frac{8}{m^3}$$

$$\frac{d^2S}{dm^2} = -\frac{8}{m^3}$$
At  $m = 2$ ,  $\frac{d^2S}{dm^2} = -1 < 0$ 

$$m = -2 \frac{d^2S}{dm^2} = 1 > 0$$

m = -2 is point of local minima.

.. least value of sum of intercept is

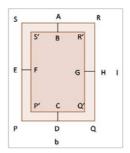

$$\frac{m-4}{m}+4-m$$

$$= 3 + 6 = 9$$

Maxima and Minima 18.5 Q43

The area of the page PQRS in 150 cm<sup>2</sup>

Also, 
$$AB + CD = 3$$
 cm  
 $EF + GH = 2$  Cm

Let x and y be the combined width of margin at the top and bottom and the sides respectively.

$$x = 3 \text{ cm and } y = 2 \text{ cm}.$$

Now, area of printed matter = area of P'Q'R'S'

$$\Rightarrow A = P'Q' \times Q'R'$$

$$\Rightarrow$$
  $A = (b - y)(l - x)$ 

$$\Rightarrow A = (b-2)(l-3) \qquad ---(i)$$

Also,

Area of 
$$PQRS = 150 \text{ cm}^2$$
  
 $\Rightarrow lb = 150$  ---(ii)

$$A = \left(b - 2\right) \left(\frac{150}{b} - 3\right)$$

.: For maximum and minimum,

$$\frac{dA}{db} = \left(\frac{150}{b} - 3\right) + \left(b - 2\right)\left(-\frac{150}{b^2}\right) = 0$$

$$\Rightarrow \frac{\left(150 - 3b\right)}{b} + \left(-150\right) \frac{\left(b - 2\right)}{b^2} = 0$$

$$\Rightarrow 150b - 3b^2 - 150b + 300 = 0$$

$$\Rightarrow -3b^2 + 300 = 0$$

$$\Rightarrow$$
  $b = 10$ 

Now,

$$\frac{d^2A}{db^2} = \frac{-150}{b^2} - 150 \left[ -\frac{1}{b^2} + \frac{4}{b^3} \right]$$

At b = 10

$$\frac{d^2A}{db^2} = -\frac{15}{10} - 150 \left[ -\frac{1}{100} + \frac{4}{1000} \right]$$
$$= -1.5 - .15 \left[ -10 + 4 \right]$$
$$= -1.5 + .9$$
$$= -0.6 < 0$$

b = 10 is point of local maxima.

Hence,

The required dimension will be l = 15 cm, b = 10 cm.

Maxima and Minima 18.5 Q44

The space s described in time t by a moving particle is given by

$$s = t^5 - 40t^3 + 30t^2 + 80t - 250$$

$$velocity = \frac{ds}{dt} = 5t^4 - 120t^2 + 60t + 80$$

$$Acceleration = a = \frac{d^2s}{dt^2} = 20t^3 - 240t + 60t$$
 ----(i)

Now,

$$\frac{da}{dt} = 60t^2 - 240$$

For maxima and minima,

$$\frac{da}{dt} = 0$$

$$\Rightarrow 60t^2 - 240 = 0$$

$$\Rightarrow 60(t^2 - 4) = 0$$

Now,

$$\frac{d^2a}{dt^2} = 120t$$
At  $t = 2$ ,  $\frac{d^2a}{dt^2} = 240 > 0$ 
 $\therefore$   $t = 2$  is point of local minima

Hence, minimum acceleration is 160 - 480 + 60 = -260.

Maxima and Minima 18.5 Q45

We have,

Distance, 
$$s = \frac{t^4}{4} - 2t^3 + 4t^2 - 7$$
  
Velocity,  $v = \frac{ds}{dt} = t^3 - 6t^2 + 8t$   
Acceleration,  $a = \frac{d^2s}{dt^2} = 3t^2 - 12t + 8$ 

For velocity to be maximum and minimum,

$$\frac{dv}{dt} = 0$$

$$\Rightarrow 3t^2 - 12t + 8 = 0$$

$$\Rightarrow t = \frac{12 \pm \sqrt{144 - 96}}{6}$$

$$= 2 \pm \frac{4\sqrt{3}}{6}$$

$$\therefore t = 2 + \frac{2}{\sqrt{3}}, 2 - \frac{2}{\sqrt{3}}$$

Now,

$$\frac{d^2v}{dt^2} = 6t - 12$$
At  $t = 2 - \frac{2}{\sqrt{3}}$ ,  $\frac{d^2v}{dt^2} = 6\left(2 - \frac{2}{\sqrt{3}}\right) - 12 = \frac{-12}{\sqrt{3}} < 0$ 

$$t = 2 + \frac{2}{\sqrt{3}}$$
,  $\frac{d^2r}{dt^2} = 6\left(2 + \frac{2}{\sqrt{3}}\right) - 12 = \frac{12}{\sqrt{3}} > 0$ 

$$\therefore \text{ At } t = 2 - \frac{2}{\sqrt{3}}$$
, velocity is maximum

For acceleration to be maximum and minimum

$$\frac{da}{dt} = 0$$

$$\Rightarrow 6t - 12 = 0$$

$$\Rightarrow t = 2$$

Now,

$$\frac{d^2a}{dt^2} = 6 > 0$$

 $\therefore$  At, t = 2 Acceleration is minimum.
