

## Arithmetic Progressions Ex 9.3 Q36

## Answer:

In the given problem, let us first find the 21st term of the given A.P.

A.P. is 3, 15, 27, 39 ...

Here,

First term (a) = 3

Common difference of the A.P. (d) = 15-3=12

Now, as we know,

$$a_n = a + (n-1)d$$

So, for  $21^{st}$  term (n = 21),

$$a_{21} = 3 + (21 - 1)(12)$$

$$=3+20(12)$$

$$=3+240$$

$$= 243$$

Let us take the term which is 120 more than the  $21^{st}$  term as  $a_n$ . So,

$$a_n = 120 + a_{21}$$

$$=120 + 243$$

$$=363$$

Also,  $a_n = a + (n-1)d$ 

$$363 = 3 + (n-1)12$$

$$363 = 3 + 12n - 12$$

$$363 = -9 + 12n$$

$$363 + 9 = 12n$$

Further simplifying, we get,

$$372 = 12n$$

$$n = \frac{370}{12}$$

$$n = 31$$

Therefore, the  $\boxed{31^{st} \, term}$  of the given A.P. is 120 more than the 21 st term.

Arithmetic Progressions Ex 9.3 Q37

## Answer:

Let a be the first term and d be the common difference.

We know that,  $n^{th}$  term =  $a_n$  = a + (n - 1)d

According to the question,

$$a_{17} = 5 + 2a_8$$
  
 $\Rightarrow a + (17 - 1)d = 5 + 2(a + (8 - 1)d)$   
 $\Rightarrow a + 16d = 5 + 2a + 14d$   
 $\Rightarrow 16d - 14d = 5 + 2a - a$   
 $\Rightarrow 2d = 5 + a$   
 $\Rightarrow a = 2d - 5$  .... (1)  
Also,  $a_{11} = 43$   
 $\Rightarrow a + (11 - 1)d = 43$   
 $\Rightarrow a + 10d = 43$  .... (2)

On substituting the values of (1) in (2), we get

$$2d - 5 + 10d = 43$$

$$\Rightarrow 12d = 5 + 43$$

$$\Rightarrow 12d = 48$$

$$\Rightarrow d = 4$$

$$\Rightarrow a = 2 \times 4 - 5 \quad [From (1)]$$

$$\Rightarrow a = 3$$

$$a_n = a + (n - 1)d$$

$$= 3 + (n - 1)4$$

$$= 3 + 4n - 4$$

$$= 4n - 1$$

Thus, the  $n^{th}$  term of the given A.P. is 4n - 1. Arithmetic Progressions Ex 9.3 Q38

## Answer:

First three-digit number that is divisible by 9 is 108.

Next number is 108 + 9 = 117.

And the last three-digit number that is divisible by 9 is 999.

Thus, the progression will be 108, 117, ...., 999.

All are three digit numbers which are divisible by 9, and thus forms an A.P. having first term a 108 and the common difference as 9.

We know that,  $n^{\text{th}}$  term =  $a_n = a + (n - 1)d$ 

According to the question,

$$999 = 108 + (n - 1)9$$
  
 $\Rightarrow 108 + 9n - 9 = 999$   
 $\Rightarrow 99 + 9n = 999$   
 $\Rightarrow 9n = 999 - 99$   
 $\Rightarrow 9n = 900$   
 $\Rightarrow n = 100$ 

Thus, the number of all three digit natural numbers which are divisible by 9 is 100.
