

Pair of Linear Equations in Two varibles Ex 3.4 Q21

Answer:

GIVEN:

 $a^2x + b^2y = c^2$

 $b^2x + a^2y = d^2$

To find: The solution of the systems of equation by the method of cross-multiplication:

Here we have the pair of simultaneous equation

$$a^2x + b^2y - c^2 = 0$$

$$b^2x + a^2y - d^2 = 0$$

By cross multiplication method we get

$$\frac{x}{\left(-d^2b^2\right) - \left(-c^2a^2\right)} = \frac{-y}{\left(-d^2a^2\right) - \left(-c^2b^2\right)} = \frac{1}{a^4 - b^4}$$
$$\frac{x}{\left(c^2a^2 - d^2b^2\right)} = \frac{y}{\left(d^2a^2 - c^2b^2\right)} = \frac{1}{a^4 - b^4}$$

Consider the following for x

$$\frac{x}{\left(c^2a^2 - d^2b^2\right)} = \frac{1}{a^4 - b^4}$$
$$x = \frac{a^2c^2 - b^2d^2}{a^4 - b^4}$$

Now consider the following for y

$$\frac{-y}{\left(-d^2a^2\right) - \left(-c^2b^2\right)} = \frac{1}{a^4 - b^4}$$

$$\frac{y}{\left(d^2a^2 - c^2b^2\right)} = \frac{1}{a^4 - b^4}$$

$$y = \frac{a^2d^2 - b^2c^2}{a^4 - b^4}$$

Hence we get the value of
$$x = \frac{a^2c^2 - b^2d^2}{a^4 - b^4}$$
 and $y = \frac{a^2d^2 - b^2c^2}{a^4 - b^4}$

Pair of Linear Equations in Two varibles Ex 3.4 Q22 **Answer:**

GIVEN:

$$\frac{57}{x+y} + \frac{6}{x-y} = 5$$

$$\frac{38}{x+y} + \frac{21}{x-y} = 9$$

To find: The solution of the systems of equation by the method of cross-multiplication:

Here we have the pair of simultaneous equation 57 6 5 0

$$\frac{57}{x+y} + \frac{6}{x-y} - 5 = 0$$

$$\frac{38}{x+y} + \frac{21}{x-y} - 9 = 0$$

let
$$\frac{1}{x+y} = u$$
 and $\frac{1}{x-y} = v$

Now rewriting the given equation as

$$57u + 6v - 5 = 0$$
(1)

$$38u + 21v - 9 = 0$$
(2)

By cross multiplication method we get

$$\frac{u}{(-9\times6)-(-5\times21)} = \frac{-v}{(-9\times57)-(-5\times38)} = \frac{1}{(21\times57)-(38\times6)}$$

$$\frac{u}{(-54)-(-105)} = \frac{-v}{(-513)-(-190)} = \frac{1}{(1197)-(228)}$$

$$\frac{u}{51} = \frac{-v}{-323} = \frac{1}{969}$$

$$\frac{u}{51} = \frac{v}{323} = \frac{1}{969}$$

Consider the following for u

$$\frac{u}{51} = \frac{1}{969}$$
$$\Rightarrow u = \frac{1}{19}$$

Consider the following for v

$$\frac{v}{323} = \frac{1}{969}$$
$$v = \frac{1}{3}$$

We know that

$$\frac{1}{x+y} = u \text{ and } \frac{1}{x-y} = v$$

$$\frac{1}{x+y} = \frac{1}{19}$$

$$x+y=19 \qquad(3)$$

$$\frac{1}{x-y} = \frac{1}{3}$$

$$x-y=3 \qquad(4)$$

Now adding eq. (3) and (4) we get x = 11

And after substituting the value of x in eq. (4) we get y = 8

Hence we get the value of x = 11 and y = 8
