

Congruent Triangles Ex 10.1 Q1

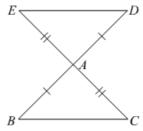

## Answer:

It is given that

BA = AD

CA = AE

We have to prove that  $DE \parallel BC$ 

Now considering the two triangles we have

In  $\triangle EAD \& \triangle BAC$ 

EA = AC (Given)

AD = AB (Given)

We need to show  $\angle CED = \angle ECB$  or  $\angle BDE = \angle DBC$  to prove  $DE \parallel BC$ .

 $\angle EAD = \angle BAC$  (Vertically opposite angle)

So by SAS congruence criterion we have

 $\Delta EAD \cong \Delta CAB$ 

So  $\angle AED = \angle ACB$  and

 $\angle ADE = \angle ABC$ 

Then

 $\angle CED = \angle ECB$ , and

 $\angle BDE = \angle ABC$ 

Hence from above conditions  $DE \parallel BC$ 

Congruent Triangles Ex 10.1 Q2

## Answer:

It is given that

$$PQ = QR$$

And L is the mid point of PQ

So 
$$PL = LQ$$

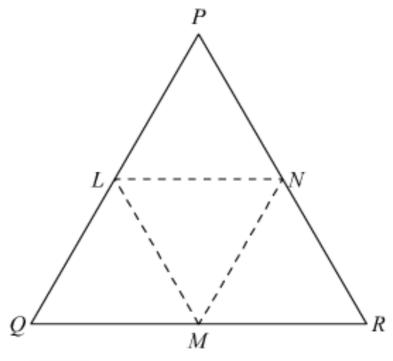

And M is the mid point of QR

So 
$$QM = MR$$

And N is the mid point of RP

So 
$$RN = NP$$

We have to prove that LM = MN

In  $\Delta PQR$ , we have

$$PQ = QR$$
 and  $\angle R = \angle P$  (Equilateral triangle)

Then

$$\frac{1}{2}PQ = \frac{1}{2}QR$$
, and  $\angle P = \angle R$ 

$$PL = MR$$
, and  $\angle P = \angle R$ 

Similarly comparing  $\Delta MRN$  and  $\Delta LPN$  we have

$$PL = MR$$
, and  $\angle P = \angle R$ 

And PN = NR (Since N is the mid point of PR)

So by SAS congruence criterion, we have

$$\Delta MRN \cong \Delta LPN$$

Hence MN = LN
