

## Division of Algebraic Expressions Ex 8.4 Q24

## Answer:

We have to find the value of a if (x+2) is a factor of  $(4x^4 + 2x^3 - 3x^2 + 8x + 5a)$ . Substituting x = -2 in  $4x^4 + 2x^3 - 3x^2 + 8x + 5a$ , we get:  $4(-2)^4 + 2(-2)^3 - 3(-2)^2 + 8(-2) + 5\mathbf{a} = 0$ 

$$4(-2)^{2} + 2(-2)^{2} - 3(-2)^{2} + 8(-2) + 5a =$$

or, 
$$64 - 16 - 12 - 16 + 5a = 0$$

or, 
$$5a = -20$$

or, 
$$a = -4$$

:. If 
$$(x+2)$$
 is a factor of  $(4x^4 + 2x^3 - 3x^2 + 8x + 5a)$ ,  $a = -4$ .

## Division of Algebraic Expressions Ex 8.4 Q25 Answer:

$$\begin{array}{r}
 x^2 + 1 \\
 x^2 + 2x - 3 \overline{\smash)} x^4 + 2x^3 - 2x^2 + x - 1 \\
 \underline{x^4 + 2x^3 - 3x^2} \\
 \underline{x^2 + x - 1} \\
 x^2 + x - 1 \\
 x^2 + 2x - 3
 \end{array}$$

Thus, (x - 2) should be added to ( $x^4+2x^3-2x^2+x-1$ ) to make the resulting polynomial exactly divisible by  $(x^2 + 2x - 3)$ .
