

Indefinite Integrals Ex 19.8 Q31

Let
$$I = \int \frac{\sec x}{\log(\sec x + \tan x)} dx - - - - - (i)$$

Let
$$\log(\sec x + \tan x) = t$$
 then,
$$d[\log(\sec x + \tan x)] = dt$$

$$\Rightarrow \qquad \sec x \, dx = dt \qquad \qquad \left[\because \qquad \frac{d}{dx} \left(\log \left(\sec x + \tan x \right) \right) = \sec x \right]$$

$$\Rightarrow \qquad dx = \frac{dt}{\sec x}$$

Putting $\log(\sec x + \tan x) = t$ and $dx = \frac{dt}{\sec x}$ in equation (i), we get,

$$I = \int \frac{\sec x}{t} \times \frac{dt}{\sec x}$$

$$= \int \frac{dt}{t}$$

$$= \log |t| + c$$

$$= \log |\cos(\sec x + \tan x)| + c$$

$$I = \log \log (\sec x + \tan x) + c$$

Indefinite Integrals Ex 19.8 Q32

Let
$$I = \int \frac{\cos ec x}{\log \tan \frac{x}{2}} dx - - - - - - - (i)$$

Let
$$\log \tan \frac{x}{2} = t$$
 then,
$$d \left[\log \tan \frac{x}{2} \right] = dt$$

$$\Rightarrow$$
 cosec x dx = dt

$$\Rightarrow cosec \times dx = dt$$

$$\Rightarrow dx = \frac{dt}{cosecx}$$

Putting $\log \tan \frac{x}{2} = t$ and $dx = \frac{dt}{\cos ecx}$ in equation (i) ,we get,

$$I = \int \frac{\cos ec x}{t} \times \frac{dt}{\cos ec x}$$
$$= \int \frac{dt}{t}$$
$$= \log|t| + c$$
$$= \log|\log \tan \frac{x}{2}| + c$$

$$I = \log \left| \log \tan \frac{x}{2} \right| + c$$

Indefinite Integrals Ex 19.8 Q33

Let
$$I = \int \frac{1}{x \log x \log (\log x)} dx - \cdots - (i)$$

Let
$$\log(\log x) = t$$
 then,
 $d[\log(\log x)] = dt$

$$\Rightarrow \frac{1}{x} \times \frac{1}{\log x} dx = dt$$

$$\Rightarrow dx = x \log x dt$$

Putting $\log(\log x) = t$ and $dx = x \log x dt$ in equation (i), we get,

$$I = \int \frac{1}{x \log x t} \times x \log x dt$$
$$= \int \frac{1}{t} dt$$
$$= \log |t| + c$$
$$= \log |\log (\log x)| + c$$

$$I = \log \log (\log x) + c$$

Indefinite Integrals Ex 19.8 Q34

Let
$$I = \int \frac{\cos ec^2 x}{1 + \cot x} dx - - - - - - - (i)$$

$$\text{Let } 1 + \cot x = t \quad \text{then,}$$

$$d \left[1 + \cot x \right] = dt$$

$$\Rightarrow - \csc^2 x \, dx = dt$$

$$\Rightarrow \qquad dx = -\frac{dt}{\cos ec^2 x}$$

Putting $1 + \cot x = t$ and $dx = \frac{-dt}{\cos ec^2 x}$ in equation (i), we get,

$$\begin{split} I &= \int \frac{\cos ec^2 x}{t} \times -\frac{dt}{\cos ec^2 x} \\ &= -\int \frac{1}{t} dt \\ &= -\log |t| + c \\ &= -\log |1 + \cot x| + c \end{split}$$

$$I = -\log|1 + \cot x| + c$$

Indefinite Integrals Ex 19.8 Q35
Let
$$I = \int \frac{10 x^9 + 10^x \log_e 10}{10^x + x^{10}} dx - - - - (i)$$

Let
$$10^{x} + x^{10} = t$$
 then,
 $d(10^{x} + x^{10}) = dt$

$$\Rightarrow \left(10^x \log_e 10 + 10x^9\right) dx = dt$$

$$\Rightarrow dx = \frac{dt}{10x^9 + 10^x \log_e 10}$$

Putting $10^x + x^{10} = t$ and $dx = \frac{dt}{10x^9 + 10^x \log_e 10}$ in equation (i), we get,

$$\begin{split} I &= \int \frac{10x^9 + 10^x |\log_e 10|}{t} \times \frac{dt}{10x^9 + 10^x |\log_e 10|} \\ &= \int \frac{dt}{t} \\ &= |\log|t| + c \\ &= |\log|10^x + x^{10}| + c \end{split}$$

$$I = \log \left| 10^x + x^{10} \right| + c$$
