

## Lines and Angles Ex 8.2 Q16

## Answer:

Let us draw TOP as a straight line.

Since, TOP is a line, therefore,  $\angle POQ$ ,  $\angle QOR$  and  $\angle ROT$  form a linear pair.

Also,  $\angle POS$  and  $\angle SOT$  form a linear pair.

Thus, we have:

$$\angle POQ + \angle QOR + \angle ROT = 180^{\circ}$$
 (i)

And

$$\angle POS + \angle SOT = 180^{\circ}$$
 (ii)

On adding (i) and (ii), we get :

Thus, we have:

$$\angle POQ + \angle QOR + \angle ROT = 180^{\circ}$$
 (i)

And

$$\angle POS + \angle SOT = 180^{\circ}$$
 (ii)

On adding (i) and (ii), we get:

$$(\angle POQ + \angle QOR + \angle ROT) + (\angle POS + \angle SOT) = 180^{\circ} + 180^{\circ}$$
  
 $\angle POQ + \angle QOR + (\angle ROT + \angle SOT) + \angle POS = 360^{\circ}$ 

$$\angle POQ + \angle QOR + \angle SOR + \angle POS = 360^{\circ}$$

Hence proved.

Lines and Angles Ex 8.2 Q17

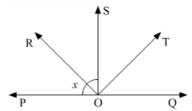

## Answer:

In the figure given below, we have Ray OR as the bisector of  $\angle POS$  Therefore,

 $\angle POR = \angle ROS$ 

Or.

 $\angle POS = 2 \angle ROS$  (1)

Similarly, Ray OT as the bisector of ∠SOQ

Therefore,

$$\angle TOQ = \angle TOS$$

Or

$$\angle QOS = 2\angle TOS$$
 (II)

Also, Ray OS stand on a line POQ. Therefore,  $\angle POS$  and  $\angle QOS$  form a linear pair. Thus.

$$\angle POS + \angle QOS = 180^{\circ}$$

From (I) and (II):

$$2\angle ROS + 2\angle TOS = 180^{\circ}$$

$$2(\angle ROS + \angle TOS) = 180^{\circ}$$

$$\angle ROS + \angle TOS = \frac{180^{\circ}}{2}$$

$$\angle ROT = 90^{\circ}$$

$$\angle ROT = 90^{\circ}$$

Hence, the value of  $\angle ROT$  is 90°.
