

Mean Value Theorems Ex 15.1 Q3(xv)

Here

$$f(x) = 4^{\sin x}$$
 on $[0, \pi]$

We know that exponential and $\sin x$ both are continuous and differentiable, so f(x) is continuous is $[0,\pi]$ and differentiable is $(0,\pi)$.

Now,

$$f(0) = 4^{\sin 0} = 4^0 = 1$$

$$f(\pi) = 4^{\sin \pi} = 4^0 = 1$$

$$\Rightarrow$$
 $f(0) = f(\pi)$

So, Rolle's theorem is applicable, so there must exist a point $c \in (0,\pi)$ such that f'(c) = 0.

Now

$$f(x) = 4^{\sin x}$$

$$f'(x) = 4^{\sin x} \log 4 \times \cos x$$

Now,

$$f'(c) = 0$$

$$4^{\sin c} \times \cos x c \log 4 = 0$$

$$\Rightarrow$$
 cosc = 0

$$\Rightarrow C = \frac{\pi}{2} \in (0, \pi)$$

Hence, Rolle's theorem is verified.

Mean Value Theorems Ex 15.1 Q3(xvi)

Here,

$$f(x) = x^2 - 5x + 4 \text{ on } [1, 4]$$

f(x) is continuous and differentiable as it is a polynomial function.

Now,

$$f(1) = (1)^2 - 5(1) + 4 = 0$$

$$f(4) = (4)^2 - 5(4) + 4 = 0$$

$$\Rightarrow f(1) = f(4)$$

So, Rolle's theorem is applicable, so there must exist a point $c \in (1,4)$ such that f'(c) = 0.

Now,

$$f(x) = x^2 - 5x + 4$$

$$f'(x) = 2x - 5$$

So,

$$f'(c) = 0$$

$$\Rightarrow$$
 2c - 5 = 0

$$\Rightarrow \qquad c = \frac{5}{2} \in (1, 4)$$

Hence, Rolle's theorem is verified.

Mean Value Theorems Ex 15.1 Q3(xvii)

Here,

$$f(x) = \sin^4 x + \cos^4 x$$
 on $\left[0, \frac{\pi}{2}\right]$

We know that sine and cosine function are differentiable and continuous.

So, f(x) is continuous is $\left[0, \frac{\pi}{2}\right]$ and it is differentiable is $\left(0, \frac{\pi}{2}\right)$.

Now,

$$f(0) = \sin^4(0) + \cos^4(0) = 1$$

$$f\left(\frac{\pi}{2}\right) = \sin^4\left(\frac{\pi}{2}\right) + \cos^4\left(\frac{\pi}{2}\right) = 1$$

$$\Rightarrow f(0) = f\left(\frac{\pi}{2}\right)$$

So, Rolle's theorem is applicable, so there must exist a point $c \in \left(0, \frac{\pi}{2}\right)$ such that f'(c) = 0.

Now,

$$f(x) = \sin^4 x + \cos^4 x$$

 $f'(x) = 4 \sin^3 x \cos x - 4 \cos^3 x \sin x$
 $= -2 (2 \sin x \cos x) (\cos^2 x - \cos^2 x)$
 $= -2 \sin 2x \cos 2x$
 $f'(x) = -\sin 4x$
Now,
 $f'(c) = 0$
 $-\sin 4x = 0$
 $\sin 4x = 0$
 $\Rightarrow x = 0$ or $4x = \pi$
 $\Rightarrow x = 0$ or $x = \frac{\pi}{4} \in (0, \frac{\pi}{2})$

Hence, Rolle's theorem is verified.

Mean Value Theorems Ex 15.1 Q3(xvii)

Since trigonometric functions are differentiable and continuous,

the given function, $f(x) = \sin x - \sin 2x$ is also continuous and differentiable.

Now
$$f(0) = \sin 0 - \sin 2 \times 0 = 0$$

and
 $f(\pi) = \sin \pi - \sin 2 \times \pi = 0$

Thus,
$$f(x)$$
 satisfies conditions of the Rolle's Theorem on $[0,\pi]$.

Therefore, there exists $c \in [0, \pi]$ such that f(c) = 0

Now
$$f(x) = \sin x - \sin 2x$$

$$\Rightarrow f'(x) = \cos x - 2\cos 2x = 0$$

$$\Rightarrow \cos x = 2\cos 2x$$

 \Rightarrow f(0) = f(π)

$$\Rightarrow \cos x = 2(2\cos^2 x - 1)$$

$$\Rightarrow \cos x = 4\cos^2 x - 2$$

$$\Rightarrow 4\cos^2 x - \cos x - 2 = 0$$

$$\Rightarrow \cos x = \frac{1 \pm \sqrt{33}}{8} = 0.8431 \text{ or } -0.5931$$

$$\Rightarrow$$
 x=cos⁻¹ (0.8431) or cos⁻¹ (-0.5931)

$$\Rightarrow$$
 x=cos⁻¹(0.8431) or 180° - cos⁻¹(0.5931) $\left[\because \cos^{-1}(-x) = \pi - \cos^{-1}(x)\right]$

$$\Rightarrow x = 32^{\circ}32' \text{ or } x = 126^{\circ}23'$$

Both 32°32' and 126°23' $\in [0, \pi]$ such that f(c) = 0.

Hence Rolle's Theorem is verified.

Mean Value Theorems Ex 15.1 Q3(xviii)

```
Since trigonometric functions are differentiable and continuous,
the given function, f(x) = \sin x - \sin 2x is also continuous and differentiable.
Now f(0) = \sin 0 - \sin 2 \times 0 = 0
and
f(\pi) = \sin \pi - \sin 2 \times \pi = 0
\Rightarrow f(0) = f(\pi)
Thus, f(x) satisfies conditions of the Rolle's Theorem on [0, \pi].
Therefore, there exists c \in [0, \pi] such that f'(c) = 0
Now f(x) = \sin x - \sin 2x
\Rightarrow f'(x) = \cos x - 2\cos 2x = 0
\Rightarrow \cos x = 2\cos 2x
\Rightarrow \cos x = 2(2\cos^2 x - 1)
\Rightarrow \cos x = 4\cos^2 x - 2
\Rightarrow 4\cos^2 x - \cos x - 2 = 0
\Rightarrow \cos x = \frac{1 \pm \sqrt{33}}{8} = 0.8431 \text{ or } -0.5931
\Rightarrow x = \cos^{-1}(0.8431) or \cos^{-1}(-0.5931)
\Rightarrow x=cos<sup>-1</sup>(0.8431) or 180° - cos<sup>-1</sup>(0.5931) \left[\because \cos^{-1}(-x) = \pi - \cos^{-1}(x)\right]
\Rightarrow x = 32^{\circ}32' \text{ or } x = 126^{\circ}23'
Both 32°32' and 126°23' \in [0, \pi] such that f(c) = 0.
Hence Rolle's Theorem is verified.
