

Algebraic Identities Ex 4.1 Q1

Answer:

In the given problem, we have to evaluate expressions by using identities.

(i) Given
$$\left[2x - \frac{1}{x}\right]^2$$

We shall use the identity $(a-b)^2 = a^2 - 2ab + b^2$

Here a = 2x

$$b = \frac{1}{x}$$

 $b = \frac{1}{x}$ By applying identity we get

$$\left[2x - \frac{1}{x}\right]^2 = (2x)^2 + \left(\frac{1}{x}\right)^2 - 2 \times 2 \times x \times \frac{1}{x}$$
$$= (2x \times 2x) + \left(\frac{1}{x} \times \frac{1}{x}\right) - 2 \times 2 \times x \times \frac{1}{x}$$
$$= (2x \times 2x) + \left(\frac{1}{x} \times \frac{1}{x}\right) - 2 \times 2 \times x \times \frac{1}{x}$$
$$= 4x^2 + \frac{1}{x^2} - 4$$

Hence the value of $\left[2x - \frac{1}{x}\right]^2$ is $\left[4x^2 + \frac{1}{x^2} - 4\right]$

(ii) We have been given (2x+y)(2x-y)

We shall use the identity $(a+b)(a-b) = a^2 - b^2$

Here, a = 2x, b = y

By applying identity we get

$$(2x+y)(2x-y) = (2x)^{2} - (y)^{2}$$
$$= (2x \times 2x) - (y \times y)$$
$$= 4x^{2} - y^{2}$$

Hence the value of (2x+y)(2x-y) is $4x^2-y^2$

(iii) The given expression is $(a^2b-b^2a)^2$

We shall use the identity $(x-y)^2 = x^2 - 2xy + y^2$

Here
$$x = a^2b$$

$$y = b^2 a$$

By applying identity we get

$$(a^{2}b - b^{2}a)^{2} = (a^{2}b)^{2} + (b^{2}a)^{2} - 2 \times a^{2}b \times b^{2}a$$
$$= (a^{2}b \times a^{2}b) + (b^{2}a \times b^{2}a) - 2 \times a^{2}b \times b^{2}a$$
$$= a^{4}b^{2} - 2a^{3}b^{3} + b^{4}a^{2}$$

Hence the value of $(a^2b-b^2a)^2$ is $a^4b^2-2a^3b^3+b^4a^2$

(iv) The given expression is (a+0.1)(a-0.1)

We shall use the identity $(x+y)(x-y) = x^2 - y^2$

Here x = a

$$y = 0.1$$

By applying identity we get

$$(a+0.1)(a-0.1) = (a)^2 - (0.1)^2$$

= $(a \times a) - (0.1 \times 0.1)$
= $a^2 - 0.01$

Hence the value of (a+0.1)(a-0.1) is $a^2-0.01$

(v) The given expression is $(1.5x^2 - 0.3y^2)(1.5x^2 + 0.3y^2)$

We shall use the identity $(a+b)(a-b) = a^2 - b^2$

Here $a = 1.5x^2$

$$b = 0.3 v^2$$

By applying identity we get

$$(1.5x^2 - 0.3y^2)(1.5x^2 + 0.3y^2) = (1.5x^2)^2 - (0.3y^2)^2$$
$$= (1.5x^2 \times 1.5x^2) - (0.3y^2 \times 0.3y^2)$$
$$= 2.25x^4 - 0.09y^4$$

Hence the value of $(1.5x^2 - 0.3y^2)(1.5x^2 + 0.3y^2)$ is $2.25x^4 - 0.09y^4$
