

Arithmetic Progressions Ex 9.5 Q28 **Answer:**

In the given problem, let us take the first term as a and the common difference as d. Here, we are given that,

$$a_2 = 14$$
(1)

$$a_3 = 18$$
(2)

Also, we know,

$$a_n = a + (n-1)d$$

For the 2^{nd} term (n = 2),

$$a_2 = a + (2-1)d$$

$$a_2 = a + (2 - 1)a$$

$$14 = a + d \qquad \text{(Using 1)}$$

$$a = 14 - d$$
(3)

Similarly, for the 3^{rd} term (n = 3),

$$a_3 = a + (3-1)d$$

$$18 = a + 2d \qquad \qquad \text{(Using 2)}$$

$$a = 18 - 2d$$
(4)

Subtracting (3) from (4), we get,

$$a-a=(18-2d)-(14-d)$$

$$0 = 18 - 2d - 14 + d$$

$$0 = 4 - d$$

$$d = 4$$

Now, to find a, we substitute the value of d in (4),

$$a = 14 - 4$$

$$a = 10$$

So, for the given A.P d = 4 and a = 10

So, to find the sum of first 51 terms of this A.P., we use the following formula for the sum of n terms of an A.P..

$$S_n = \frac{n}{2} \Big[2a + (n-1)d \Big]$$

Where; a =first term for the given A.P.

d = common difference of the given A.P.

n = number of terms

So, using the formula for n = 51, we get,

$$S_{51} = \frac{51}{2} \Big[2(10) + (51-1)(4) \Big]$$

$$= \frac{51}{2} \Big[20 + (50)(4) \Big]$$

$$= \frac{51}{2} \Big[20 + 200 \Big]$$

$$= \frac{51}{2} \Big[220 \Big]$$

$$= 51(110)$$

$$= 5610$$

Therefore, the sum of first 51 terms for the given A.P. is $S_{51} = 5610$

Arithmetic Progressions Ex 9.5 Q29

Answer:

In the given problem, we need to find the sum of n terms of an A.P. Let us take the first term as a and the common difference as d.

Here, we are given that,

$$S_7 = 49$$
(1)
 $S_{17} = 289$ (2)

So, as we know the formula for the sum of n terms of an A.P. is given by,

$$S_n = \frac{n}{2} \Big[2a + (n-1)d \Big]$$

Where; a = first term for the given A.P.

d = common difference of the given A.P.

n = number of terms

So, using the formula for n = 7, we get,

$$S_7 = \frac{7}{2} \Big[2(a) + (7-1)(d) \Big]$$

$$49 = \left(\frac{7}{2}\right) \Big[2a + (6)(d) \Big]$$
 (Using 1)
$$49 = \frac{14a + 42d}{2}$$

$$49 = 7a + 21d$$

Further simplifying for a, we get,

$$a = \frac{49 - 21d}{7}$$

$$a = 7 - 3d \qquad(3)$$

Also, using the formula for n = 17, we get,

$$S_{17} = \frac{17}{2} \Big[2(a) + (17 - 1)(d) \Big]$$

$$289 = \left(\frac{17}{2}\right) \Big[2a + (16)(d) \Big] \qquad \text{(Using 2)}$$

$$289 = \frac{(17)(2)a + (17)(16)d}{2}$$

$$289 = 17a + 136d$$

Further simplifying for a, we get,

$$a = \frac{289 - 136d}{17}$$

$$a = 17 - 8d \qquad(4)$$

Subtracting (3) from (4), we get,

$$a-a = (17-8d)-(7-3d)$$

$$0 = 17-8d-7+3d$$

$$0 = 10-5d$$

$$5d = 10$$

$$d = 2$$

Now, to find a, we substitute the value of d in (3),

$$a = 7 - 3(2)$$

$$a = 7 - 6$$

$$a = 1$$

Now, using the formula for the sum of n terms of an A.P., we get,

$$S_n = \frac{n}{2} \Big[2(1) + (n-1)(2) \Big]$$
$$= \frac{n}{2} \Big[2 + 2n - 2 \Big]$$
$$= \left(\frac{n}{2} \right) (2n)$$
$$= n^2$$

Therefore, the sum of first n terms for the given A.P. is $S_n = n^2$.
